Online Adobe AD0-E725 Version, Valid AD0-E725 Dumps Demo

Adobe AD0-E725 reliable brain dumps are promised to help you clear your AD0-E725 test certification with high scores. AD0-E725 questions & answers will contain comprehensive knowledge, which will ensure high hit rate and best pass rate. When you

choose AD0-E725 PdfTorrent, you will get your AD0-E725 certification with ease, which will be the best choice to accelerate your career as a professional in the Information Technology industry.

Adobe Commerce Developer Expert Sample Questions (Q14-Q19):

NEW QUESTION # 14

A client requests changes to their Pro Staging and Production environments. They supply a Developer with different domains for new websites to be created with the goal of expanding operations to multiple countries, doubling the current number of SKUs, and adding more customer groups.

Which two issues should the Developer anticipate based on the requested changes? (Choose two.)

- A. Additional stores can lead to a longer indexing process and slower response times for noncached catalog pages.
- B. Recreate hierarchy navigation for every new website.
- C. Multiple websites may require duplicating custom functionality for each store, which increases code redundancy.
- D. Catalog data expands as the number of websites and stores are increased.

Answer: A,D

Explanation:

When new websites and stores are added in Adobe Commerce:

The catalog data expands because product, price, inventory, and configuration data must be stored per website/store (B).

Indexing becomes more complex as indexers must recalculate data per website/store, which can increase indexing times and slow down noncached catalog pages (C).

A is incorrect because navigation hierarchy is managed via categories, not recreated per website automatically.

D is incorrect because Magento code is shared across stores; functionality is not duplicated per store.

NEW QUESTION # 15

A Developer is working on a new controller in admin panel. Per requirements, it must be accessible only for specific admin users. According to best practices, how should the Developer secure access to the new controller?

- A. Override `ADMIN_RESOURCE` constant with a value for a custom access control list (ACL) resource.
- B. Implement `isAllowed` method from `AuthorizationInterface` and check the result for a custom access control list (ACL) resource.
- C. Override `_isAllowed` method and check the authorization result for a custom access control list (ACL) resource.

Answer: A

NEW QUESTION # 16

A client reports an issue with indexers that are failing and remain stuck. The client asks a Developer to solve this issue. What recommended solution should the Developer use?

- A. Run `bin/magento indexer:set-mode realtime <indexer_list>`.
- B. In `app/etc/env.php` set `indexer_sync_mode -> false` under the indexer node.
- C. Create a cron job that runs `bin/magento indexer:reindex` periodically.

Answer: B

Explanation:

Adobe Commerce recommends running indexers in asynchronous (scheduled) mode, not realtime mode.

This is because:

* Realtime mode (Option C) updates indexers every time related data changes, which causes performance issues and potential indexer lockups under high load.

* Manual cron job (Option A) is not recommended since Adobe Commerce already has a built-in cron system that manages indexers efficiently when properly configured.

* Setting `indexer_sync_mode -> false` in `app/etc/env.php` (Option B) ensures that indexers run in "scheduled" mode, meaning they

are updated via cron jobs in the background. This prevents them from becoming stuck in the "processing" state and aligns with Adobe's best practices for production environments.

This configuration change tells Magento to defer indexing operations to scheduled jobs, which helps avoid race conditions and long-running lock issues.

Official Documentation Extracts:

* "Adobe recommends running indexers on schedule (asynchronous mode). This is controlled by the indexer configuration in the app/etc/env.php file."- Adobe Commerce DevDocs: Configure indexers

* "To enable scheduled (asynchronous) indexing, set indexer_sync_mode to false in app/etc/env.php.

This is the recommended mode for production systems."- Adobe Commerce Configuration Reference

NEW QUESTION # 17

A Developer is tasked with extending the GraphQL capabilities of a client's Adobe Commerce project by adding custom attributes to the product query.

Which step should the Developer take to correctly implement this GraphQL customization?

- A. Add aroundGetList and afterGetList plugins to the ProductRepositoryInterface to reflect the new attributes.
- B. Add new attributes in the Adobe Commerce admin panel to reflect the additions.
- C. Extend the ProductInterface by creating a schema.graphqls file in the custom module's etc directory.

Answer: C

Explanation:

The correct way to extend GraphQL is to extend the schema via schema.graphqls.

Define new fields for ProductInterface.

Provide a resolver class to return the attribute values.

B is incorrect: adding attributes in admin does not automatically expose them in GraphQL.

C is incorrect: repository plugins affect service contracts, not GraphQL schema definitions.

Reference:

Adobe Commerce DevDocs - Extend GraphQL schema

NEW QUESTION # 18

An Adobe Commerce Developer is tasked to frequently send data to a third-party API. The API utilizes a JSON Web Token (JWT) that expires every hour. The developer decides to store the JWT in a custom cache.

Which step should the Developer take to implement this new custom cache type correctly?

- A. Define the custom cache type in cache.xml with a unique name and instance.
- B. Define the custom cache type in the di.xml, ensuring the cache model implements CacheInterface.
- C. Define the custom cache type directly in system.xml at the website level.

Answer: A

Explanation:

To create a custom cache type in Adobe Commerce:

Define the cache type in etc/cache.xml with a unique ID and class instance.

This ensures Magento recognizes the cache type and allows managing it with cache commands.

Option A is incorrect; DI configuration is not where cache types are defined.

Option C is wrong; system.xml defines admin configurations, not cache types.
