The authority of ISC CISSP Exam Questions rests on its being high-quality and prepared according to the latest pattern.

ISC CISSP (Certified Information Systems Security Professional) Certification Exam is a globally recognized certification for professionals in the field of information security. Certified Information Systems Security Professional (CISSP) certification is awarded by the International Information System Security Certification Consortium, also known as (ISC)². CISSP exam is designed to validate the skills and knowledge of candidates in various domains of information security, including cybersecurity, risk management, asset security, and more.

What are ACSA credentials?

The Associate level normally requires two exams to achieve. The Associate exam is an objective test that candidates can take online or on skype, while professional exam candidates only have access to one option. ACSA certification holders are able to earn up to 12 continuing education units through their participation in the ISSA - ISC Security Forum of Interest Community of Interest (COI) and at most 16 continuing education units through their participation in the IT Security Resources Community of Interest (CIOI) which are also covered in our **CISSP Dumps**. The ACSA consists of a single certification covering all aspects of computer security. It is a foundational certification for information security professionals. This credential provides a foundation for the core skills required of entry-level information security professionals and the fundamental knowledge for career growth into more advanced positions, or to prepare for certifications at a higher level. Passing this exam does not qualify a candidate for any CISSP Certification nor does it make an individual eligible for any other ISC credential.

NEW QUESTION # 1253

Within a large organization, what business unit is BEST positioned to initiate provisioning and deprovisioning of user accounts?

- A. Internal audit
- B. Training department
- **C. Human resources**
- D. Information technology (IT)

Answer: C

Explanation:

The business unit that is best positioned to initiate provisioning and deprovisioning of user accounts within a large organization is human resources. Provisioning and deprovisioning are the processes that involve granting or revoking the access rights and privileges for the users or employees of an organization, based on their roles and responsibilities. Human resources is the business unit that is responsible for managing the human resources of the organization, and for ensuring that the users or employees have the appropriate access rights and privileges to perform their duties and functions. Human resources can initiate provisioning and deprovisioning of user accounts by creating, updating, or terminating the user or employee accounts, and by communicating the access requirements and changes to the other business units, such as IT, security, or operations.

NEW QUESTION # 1254

Which of the following can best be defined as a cryptanalysis technique in which the analyst tries to determine the key from knowledge of some plaintext-ciphertext pairs?

- A. A known-plaintext attack
- B. A chosen-ciphertext attack
- C. A chosen-plaintext attack
- D. A known-algorithm attack

Answer: A

Explanation:

RFC2828 (Internet Security Glossary) defines a known-plaintext attack as a cryptanalysis technique in which the analyst tries to determine the key from knowledge of some plaintext-ciphertext pairs (although the analyst may also have other clues, such as the knowing the cryptographic algorithm). A chosen-ciphertext attack is defined as a cryptanalysis technique in which the analyst tries to determine the key from knowledge of plaintext that corresponds to ciphertext selected (i.e., dictated) by the analyst. A chosen-plaintext attack is a cryptanalysis technique in which the analyst tries to determine the key from knowledge of ciphertext that corresponds to plaintext selected (i.e., dictated) by the analyst. The other choice is a distracter.

The following are incorrect answers:

A chosen-plaintext attacks

The attacker has the plaintext and ciphertext, but can choose the plaintext that gets encrypted to see the corresponding ciphertext. This gives her more power and possibly a deeper understanding of the way the encryption process works so she can gather more information about the key being used. Once the key is discovered, other messages encrypted with that key can be decrypted.

A chosen-ciphertext attack

In chosen-ciphertext attacks, the attacker can choose the ciphertext to be decrypted and has access to the resulting decrypted plaintext. Again, the goal is to figure out the key. This is a harder attack to carry out compared to the previously mentioned attacks, and the attacker may need to have control of the system that contains the cryptosystem.

A known-algorithm attack

Knowing the algorithm does not give you much advantage without knowing the key. This is a bogus detractor. The algorithm should be public, which is the Kerckhoffs's Principle . The only secret should be the key.

NEW QUESTION # 1255

Which of the following actions should be undertaken prior to deciding on a physical baseline Protection Profile (PP)?

- A. Conduct a site survey.
- B. Check the technical design.
- C. Choose a suitable location.
- D. Categorize assets.

Answer: A

Explanation:

Conducting a site survey is the action that should be undertaken prior to deciding on a physical baseline Protection Profile (PP). A PP is a document that defines the security requirements and objectives for a system or a product, and that can be used as a basis for evaluation, testing, or certification. A physical baseline PP is a type of PP that focuses on the physical security aspects of a system or a product, such as the locks, doors, windows, fences, cameras, alarms, or sensors. Conducting a site survey is a process that involves inspecting, measuring, and documenting the physical characteristics and conditions of a site, such as the layout, dimensions, access points, environmental factors, or potential threats. Conducting a site survey can help to determine the appropriate physical security requirements and objectives for a system or a product, and to select the suitable physical security controls and measures to meet those requirements and objectives.
