

Certification CWAP-405 Dump, Exam Dumps CWAP-405 Demo

2026 Latest DumpsTorrent CWAP-405 PDF Dumps and CWAP-405 Exam Engine Free Share: <https://drive.google.com/open?id=1dZYfDzuVdSaYY0e0pkj2thyNe9Uc6i54>

These CWAP-405 practice exams train you to manage time so that you can solve questions of the CWAP-405 real test on time. DumpsTorrent offers CWNP practice tests which provide you with real examination scenarios. By practicing under the pressure of CWAP-405 real test again and again, you can overcome your Certified Wireless Analysis Professional exam anxiety. Taking CWAP-405 these practice exams is important for you to attempt CWNP real dumps questions and pass CWAP-405 certification exam test on the first take.

In order to meet the request of current real test, the technology team of research on DumpsTorrent CWNP CWAP-405 exam materials is always update the questions and answers in time. We always accept feedbacks from users, and take many of the good recommendations, resulting in a perfect DumpsTorrent CWNP CWAP-405 Exam Materials. This allows DumpsTorrent to always have the materials of highest quality.

Exam Dumps CWAP-405 Demo & CWAP-405 Valid Exam Cost

Have you been many years at your position but haven't got a promotion? Or are you a new comer in your company and eager to make yourself outstanding? Our CWAP-405 exam materials can help you. With our CWAP-405 exam questions, you can study the most latest and specialized knowledge to deal with the problems in you daily job as well as get the desired CWAP-405 Certification. You can lead a totally different and more successfully life latter on.

CWNP Certified Wireless Analysis Professional Sample Questions (Q67-Q72):

NEW QUESTION # 67

When performing protocol analysis, you notice a high number of RTS/CTS frames being transmitted on an HT network. You suspect this may be due to HT protection mechanisms. Where in the Beacon frame would you look to determine which one of the

four HT protection modes the AP is operating in?

- A. HT Information Element
- B. Non-HT Present Element
- C. HT Protection Element
- D. HT Operation Element

Answer: A

Explanation:

When performing protocol analysis, you would look at the HT Information Element in the Beacon frame to determine which one of the four HT protection modes the AP is operating in. The HT Information Element contains various subfields that provide information about the HT network configuration and operation. One of these subfields is the HT Protection field, which indicates whether any protection mechanisms are required for mixed-mode operation with non-HT STAs. The four possible values for this field are:

* No Protection: No protection mechanisms are required.

* Non-member Protection: RTS/CTS or CTS-to-self protection is required for all HT transmissions.

* 20 MHz Protection: RTS/CTS or CTS-to-self protection is required for all HT transmissions using a 40 MHz channel.

* Non-HT Mixed Mode: All HT transmissions must use a non-HT preamble and header. References:

NEW QUESTION # 68

Recently, three rogue APs have been connected to the network and later discovered. You want to prevent future rogue AP installations as much as possible.

What is the first step to eliminating or reducing rogue APs on the network?

- A. Define a direct policy that stipulates the ramifications of installing unauthorized devices
- B. Enable rogue detection in the existing authorized APs
- C. Use IPSec between every AP and the network infrastructure
- D. Create a hash of the MAC addresses of all authorized devices and continually scan for non-matching hashes

Answer: B

NEW QUESTION # 69

What is an AIFS?

- A. The shortest period of time a STA can sleep
- B. A form of aggregation performed at the PHY layer based on 802.11e UP values interpreted from DSCP values
- C. A medium access method introduced by 802.11n, but never implemented
- D. A variable Interframe Space introduced by 802.11e to help prioritize medium access for different Access Categories

Answer: D

Explanation:

An AIFS is a variable interframe space introduced by 802.11e to help prioritize medium access for different Access Categories (ACs). An interframe space is a period of time that a STA (station) has to wait before attempting to access the medium. An AIFS is a type of interframe space that varies depending on the AC of the traffic. An AC is a logical queue that corresponds to a QoS (Quality of Service) level for different types of traffic. There are four ACs defined by 802.11e: AC_VO (Voice), AC_VI (Video), AC_BE (Best Effort), and AC_BK (Background). Each AC has a different AIFSN (Arbitration Interframe Space Number) value, which determines how long it has to wait before attempting to access the medium. A lower AIFSN value means a higher priority and a shorter waiting time. The other options are not correct, as they do not describe what an AIFS is. An AIFS is not a medium access method introduced by 802.11n, but never implemented, as it is part of the 802.11e standard and widely used in QoS-enabled WLANs. An AIFS is not a form of aggregation performed at the PHY layer based on 802.11e UP values interpreted from DSCP values, as aggregation is a technique that combines multiple frames into one larger frame to improve efficiency and throughput, not prioritization or medium access. An AIFS is not the shortest period of time a STA can sleep, as sleeping is a power saving mode that allows a STA to conserve battery power by periodically turning off its radio, not accessing the medium. NEW QUESTION # 70

What is the Extended IFS used in 802.11 contention?

- A. When the lower data rates are used and you want the fastest medium access times
- B. When a frame reception begins but the received frame is incomplete or corrupted based on the FCS
- C. When 802.11ac must coexist with 802.11n
- D. When the higher data rates are used and you want the fastest medium access times

Answer: C

NEW QUESTION # 71

Which one of the following statements is not true concerning DTIMs?

- A. The DTIM interval can dictate when an STA will wake up to listen to beacon frames
- B. Every Beacon frame must contain a DTIM
- C. DTIM stands for Delivery Traffic Indication Map
- D. Buffered Broadcast and Multicast traffic will be transmitted following a DTIM

Answer: B

Explanation:

Every Beacon frame must contain a DTIM is not a true statement concerning DTIMs. DTIM stands for Delivery Traffic Indication Message, and it is a subfield within the TIM (Traffic Indication Map) element in a Beacon frame. The DTIM indicates how many Beacon frames (including the current one) will appear before the next DTIM. For example, if the DTIM interval is set to 3, it means that every third Beacon frame will contain a DTIM. Buffered broadcast and multicast traffic will be transmitted following a DTIM, so that STAs in power save mode can wake up and receive them. The DTIM interval can also dictate when an STA will wake up to listen to Beacon frames, as some STAs may choose to only listen to Beacon frames that contain a DTIM. NEW QUESTION # 72

.....

It is known to us that getting the CWAP-405 certification is not easy for a lot of people, but we are glad to tell you good news. The CWAP-405 study materials from our company can help you get the certification in a short time. Now we are willing to let you know our CWAP-405 Practice Questions in detail on the website, we hope that you can spare your valuable time to have a look to our products. Please believe that we will not let you down.
