Salesforce Certified Data Architect Sample Questions (Q57-Q62):

NEW QUESTION # 57
Ursa Major Solar has defined a new Data Quality Plan for their Salesforce data.
Which two approaches should an Architect recommend to enforce the plan throughout the organization? (Choose two.)

- A. Schedule a weekly dashboard displaying records that are missing information to be sent to managers for review.
- B. Ensure all data is stored in an external system and set up an integration to Salesforce for view-only access.
- C. Enforce critical business processes by using Workflow, Validation Rules, and Apex code.
- D. Schedule reports that will automatically catch duplicates and merge or delete the records every week.

Answer: A,C

Explanation:
Enforcing critical business processes by using Workflow, Validation Rules, and Apex code can help ensure data quality and consistency by applying rules and logic to the data entry and update3. Scheduling a weekly dashboard displaying records that are missing information to be sent to managers for review can help identify and fix data quality issues by providing visibility and accountability4.

NEW QUESTION # 58
Universal Container has implemented Sales Cloud to manage patient and related health records. During a recent security audit of the system it was discovered that same standard and custom fields need to encrypted.
Which solution should a data architect recommend to encrypt existing fields?

- A. Implement shield platform encryption to encrypt and standard fields
- B. Expert data out of Salesforce and encrypt custom and standard fields.
- C. Use Apex Crypto Class encrypt customer and standard fields.
- D. Implement classic encryption to encrypt custom and standard fields.

Answer: A

NEW QUESTION # 59
Every year, Ursa Major Solar has more than 1 million orders. Each order contains an average of 10 line items.
The Chief Executive Officer (CEO) needs the Sales Reps to see how much money each customer generates year-over-year.
However, data storage is running low in Salesforce.
Which approach for data archiving is appropriate for this scenario?

- A. 1. Annually aggregate order amount data to store in a custom object. 2. Delete those orders and order line items.
- B. 1. Annually export and delete order line items. 2. Store them in a zip file in case the data is needed later.
- C. 1. Annually export and delete orders and order line items. 2. Store them in a zip file in case the data is needed later.
- D. 1. Annually delete orders and order line items. 2. Ensure the customer has order information in another system.

Answer: A

Explanation:
Option B is the most appropriate approach for data archiving in this scenario1. By aggregating order amount data at a summary level and storing it in a custom object, you can reduce data storage and still provide visibility to the Sales Reps on how much money each customer generates year-over-year. Option A is not correct because storing data in a zip file does not make it available in Salesforce. Option C is not correct because exporting and deleting orders and order line items may lose important details that are needed for analysis or reporting. Option D is not correct because deleting orders and order line items without exporting them may cause data loss or inconsistency if the customer does not have order information in another system.

NEW QUESTION # 60
Universal Containers (UC) is migrating data from legacy system to Salesforce. During data analysis it was discovered that data types of fields being migrated do not match with Salesforce data types.
Which solution should a data architect use to ensure successful data migrations?

- A. Migrate legacy data to a staging database for mapping then leverage an ETL tool to transform the data and load into Salesforce.
- B. Export legacy data into the staging database and leverage stored procedures to transform data types before loading into Salesforce.
- C. Export legacy data into CSV files and leverage data loader to load data into Salesforce.
- D. Migrate the legacy data leveraging an ETL tool to transform data types and load data into Salesforce.

Answer: D

Explanation:
According to this article, migrating the legacy data leveraging an ETL tool to transform data types and load data into Salesforce can be a way to ensure successful data migrations. The article states that ETL tools can help with data cleansing, mapping, transformation, and loading, and that they can handle different data types and formats. The article also provides some best practices for data migration, such as identifying the data to migrate, creating templates for the data, preparing the destination org, and validating the data.

NEW QUESTION # 61

An Architect needs to document the data architecture for a multi-system, enterprise Salesforce implementation.
Which two key artifacts should the Architect use? (Choose two.)

- A. Integration specification
- B. Data model
- C. User stories
- D. Non-functional requirements

Answer: A,B
