Salesforce AP-202 Questions and Start Preparation Today [2026]

Passing the AP-202 exam with least time while achieving aims effortlessly is like a huge dream for some exam candidates. Actually, it is possible with our proper AP-202 learning materials. To discern what ways are favorable for you to practice and what is essential for exam syllabus, our experts made great contributions to them. All AP-202 Practice Engine is highly interrelated with the exam. You will figure out this is great opportunity for you. Furthermore, our AP-202 training quiz is compiled by professional team with positive influence and reasonable price

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q143-Q148):

NEW QUESTION # 143

Universal Containers (UC) is ready to build a tax provider class using the interfaces available in the Buyer Experience SDK. When creating a tax provider, what are three things that a developer should consider first?

- A. Steps to complete in the Tax Service
- B. Whether to use JSON or XML
- C. What to implement
- D. What events to fire in the Lightning web component
- E. How to handle results

Answer: A,C,E

Explanation:

When creating a tax provider, three things that a developer should consider first are: steps to complete in the tax service, how to handle results, and what to implement. Steps to complete in the tax service are the actions that the developer needs to perform to connect to and use the third-party tax service provider's API or service. These steps may include authentication, authorization,

request formatting, response parsing, error handling, and logging. How to handle results are the actions that the developer needs to perform to process and apply the tax calculation results from the tax service to the cart or order. These actions may include creating or updating cart items with type of Charge and charge type of Tax, applying tax adjustments or exemptions, and displaying tax amounts and details on the storefront. What to implement are the methods that the developer needs to define in their custom Apex class that implements the `sfdc_checkout.TaxCalculations` interface. The interface provides methods for customizing the tax calculation logic for a cart or an order, such as `getTaxRatesAndRules`, `applyTaxAmountsAndAdjustments`, and `handleTaxErrorsAndExceptions`. Whether to use JSON or XML is not something that the developer should consider first, as it is not a critical or relevant factor for creating a tax provider. It may depend on the format that the tax service provider supports or prefers, but it does not affect the overall functionality or performance of the tax integration. What events to fire in the Lightning web component is not something that the developer should consider first either, as it is not related to creating a tax provider. It may be an optional feature that the developer can add to enhance the user interface or user experience of their storefront, but it does not affect the core logic or functionality of the tax integration. Salesforce B2B Commerce Developer Guide: Tax Integration, [B2B Commerce Developer Guide: Tax Calculations Interface]

NEW QUESTION # 144

What should a developer's implementation code return if the External Prices are the same as Sales Prices for Products in the Cart?

- A. `sfdc_checkout.IntegrationStatus.Status.SUCCESS`
- B. `sfdc_checkout.IntegrationStatus.FAILED.Status`
- C. `sfdc_checkout.IntegrationStatus.Status.FAILED`
- D. `sfdc_checkout.IntegrationStatus.Success.STATUS`

Answer: A

Explanation:

When implementing code for external pricing comparisons, if the external prices are the same as the sales prices for products in the cart, the implementation should ideally return a status indicating success (such as `sfdc_checkout.IntegrationStatus.Status.SUCCESS`). This indicates that the external pricing verification has passed and there are no discrepancies between the external and sales prices.

NEW QUESTION # 145

A developer used slots to pass content from one Lightning Web Component to another. How can they access the DOM for what was passed to those slots?

- A. Call `this.template.querySelector()` and `this.template.querySelectorAll()`
- B. Call `this.querySelector()` passing an id
- C. Call `this.template.querySelector()` passing an id
- D. Call `this.querySelector()` and `this.querySelectorAll()`

Answer: A

Explanation:

In Lightning Web Components, to access the DOM elements within the component's template, including those passed into slots, developers use `this.template.querySelector()` and `this.template.querySelectorAll()`. These methods allow for querying the component's local DOM. Direct DOM manipulation or querying outside the component's template is discouraged to maintain component encapsulation and security. For more information, see the Salesforce LWC documentation on accessing the DOM: [Salesforce LWC DOM Access Documentation](#).

NEW QUESTION # 146

What interface must a developer implement to override Tax in Checkout?

- A. `sfdc_commerce.CartTaxCalculations`
- B. `sfdc.commerce.TaxCalculations`
- C. `sfdc_checkout.TaxCalculations`
- D. `sfdc.commerce.CheckoutTaxCalculations`
- E. `sfdc.checkout.CartTaxCalculations`

Answer: C

Explanation:

To override tax in checkout, a developer must implement the `sfdc_checkout.TaxCalculations` interface. The `sfdc_checkout.TaxCalculations` interface is an Apex interface that provides methods for customizing the tax calculation logic for a cart or an order. The interface allows the developer to define how to retrieve tax rates and rules, how to apply tax amounts and adjustments, and how to handle tax errors and exceptions. The developer can use the `sfdc_checkout.TaxCalculations` interface to integrate with a third-party tax service provider or to implement their own tax calculation logic. The other interfaces do not exist or are not related to tax calculation. Salesforce B2B Commerce Developer Guide: Tax Integration, B2B Commerce Developer Guide: Tax Calculations Interface

NEW QUESTION # 147

How can a developer make an integration available for selection?

- A. Modify the StoreIntegrated Service to map to an Apex class id using workbench
- **B. Create a RegisteredExternalService record using Workbench**
- C. Enter the integration class name and version in Store Administration
- D. The integration is available once it is uploaded

Answer: B

Explanation:

To make an integration available for selection in Salesforce B2B Commerce, a developer must create a `RegisteredExternalService` record. This can be accomplished using tools like Workbench, which allow for direct interaction with Salesforce's backend database. By registering the external service, the integration becomes selectable within the B2B Commerce setup, allowing it to be associated with specific stores or contexts. Salesforce documentation on integrating external services with B2B Commerce provides step-by-step instructions on registering these services to enable seamless integration and functionality within the platform.

NEW QUESTION # 148

.....

Salesforce AP-202 latest exam lab questions are collected and arranged based on latest exam questions and new information materials. It covers a range wide and includes latest exam knowledge points. If you are urgent to pass exam AP-202 Latest Exam lab questions will be the best preparation materials for you. Complete and valid exam study learning materials will help you save time cost and economic cost, then clear exam easily.
