DS0-001

A business analyst queries the same few tables every quarter and does not want to write new SQL code every time. Which of the following would best support the business analyst's needs and allow the database administrator to optimize disk space?

Option A :

Table

Option B :

View

Option C :

Function

Option D :

Stored procedure

Correct Answer: B

QUESTION: 9

A business analyst is using a client table and an invoice table to create a database view that shows clients who have not made purchases yet. Which of the following joins is most appropriate for the analyst to use to create this database view?

Option A :

INNER JOIN ON Client.Key = Invoice.Key

Option B :

RIGHT JOIN ON Client.Key = Invoice.Key WHERE BY Client.Key IS NULL

Option C :

CompTIA DataSys+ Certification Exam (DS0-001) dumps PDF version is printable and embedded with valid CompTIA DS0-001 questions to help you get ready for the CompTIA DataSys+ Certification Exam (DS0-001) exam quickly. CompTIA DataSys+ Certification Exam (DS0-001) exam dumps pdf are also usable on several smart devices. You can use it anywhere at any time on your smartphones and tablets. We update our CompTIA DS0-001 Exam Questions bank regularly to match the changes and improve the quality of DS0-001 Questions so you can get a better experience.

CompTIA DS0-001 Exam Syllabus Topics:

Topic	Details
-------	---------

Topic 1	<ul style="list-style-type: none"> • Data and Database Security: This topic focuses on data security concepts, governance and regulatory compliance purposes, implementing authentication and authorization policies and best practices. Additionally, the topic discusses database infrastructure security, and understanding types of attacks and their effects on data systems.
Topic 2	<ul style="list-style-type: none"> • Database Management and Maintenance: Here, you'll learn about monitoring and reporting for database management and performance, common database maintenance processes, documentation production, and relevant tools usage. Lastly, the topic focuses on implementing data management tasks.
Topic 3	<ul style="list-style-type: none"> • Database Fundamentals: This topic covers database structure types, SQL code development and modification based on scenarios, comparison of scripting methods and environments, and the impact of programming on database operations.
Topic 4	<ul style="list-style-type: none"> • Business Continuity: Finally, this topic covers the importance of disaster recovery techniques. Moreover, the topic explains backup and restore best practices and processes.
Topic 5	<ul style="list-style-type: none"> • Database Deployment: In this topic, you'll find discussions on database planning and design aspects. It also focuses on the implementation, testing, and deployment phases of databases.

CompTIA DataSys+ Certification Exam Sample Questions (Q20-Q25):

NEW QUESTION # 20

Which of the following is used to write SQL queries in various programming languages?

- **A. Object-relational mapping**
- B. Normalization
- C. Excel
- D. Indexing

Answer: A

Explanation:

The option that is used to write SQL queries in various programming languages is object- relational mapping. Object-relational mapping (ORM) is a technique that maps objects in an object-oriented programming language (such as Java, Python, C#, etc.) to tables in a relational database (such as Oracle, MySQL, SQL Server, etc.). ORM allows users to write SQL queries in their preferred programming language without having to deal with the differences or complexities between the two paradigms. ORM also provides users with various benefits such as code reuse, abstraction, validation, etc. The other options are either not related or not effective for this purpose. For example, indexing is a technique that creates data structures that store the values of one or more columns of a table in a sorted order to speed up queries; Excel is a software application that allows users to organize and manipulate data in rows and columns; normalization is a process that organizes data into tables and columns to reduce redundancy and improve consistency.

NEW QUESTION # 21

Which of the following is the preferred data structure for storing hierarchical data models?

- **A. Tree**
- B. Graph
- C. Queue
- D. Stack

Answer: A

Explanation:

A tree data structure is ideal for representing hierarchical data models, as it organizes data in parent-child relationships.

NEW QUESTION # 22

Several users received a message from the Chief Executive Officer asking them for their bank account details. Which of the following types of attacks is taking place?

- **A. Phishing**
- B. Brute-force
- C. Malware
- D. Denial of service

Answer: A

NEW QUESTION # 23

Which of the following does a database administrator need to know before planning the setup of a new server for a client?

- A. The connectivity status of the server
- B. The performance of the server
- **C. The size and importance of the server**
- D. The transaction logs for the server

Answer: C

Explanation:

Knowing the size and importance of the server is crucial for proper planning, as it determines the required resources, configurations, and level of redundancy needed to meet the client's needs.

NEW QUESTION # 24

Which of the following indexes stores records in a tabular format?

- **A. Columnstore**
- B. Secondary
- C. Non-clustered
- D. Unique

Answer: A

Explanation:

The index that stores records in a tabular format is columnstore. A columnstore index is a type of index that stores and compresses data by columns rather than by rows. A columnstore index can improve the performance and efficiency of queries that perform aggregations, calculations, or analysis on large amounts of data, such as data warehouse or business intelligence applications. A columnstore index can also reduce the storage space required for data by applying various compression techniques, such as dictionary encoding, run-length encoding, bit packing, etc. The other options are either different types of indexes or not related to indexes at all. For example, a non-clustered index is a type of index that stores the values of one or more columns in a sorted order along with pointers to the corresponding rows in the table; a unique index is a type of index that enforces uniqueness on one or more columns in a table; a secondary index is an alternative term for a non-clustered index.
