100% Pass 2026 XSOAR-Engineer: Efficient Valid Palo Alto Networks XSOAR Engineer Real Test

We provide first-rate service on the XSOAR-Engineer learning prep to the clients and they include the service before and after the sale, 24-hours online customer service and long-distance assistance, the refund service and the update service. The client can try out our and download XSOAR-Engineer Guide materials freely before the sale and if the client have problems about our XSOAR-Engineer study braindumps after the sale they can contact our customer service at any time.

Palo Alto Networks XSOAR Engineer Sample Questions (Q48-Q53):

NEW QUESTION # 48

Which two statements accurately describe layouts? (Choose two.)

- A. Layouts add or remove custom fields from an incident type
- **B. Layouts can display incident information and custom fields**
- C. Layouts override classification and mapping
- **D. New tabs can be added to the incident layout**

Answer: B,D

NEW QUESTION # 49

Assuming an incident type configuration runs the associated playbook automatically, which pre-process rule action can preserve matching incidents without triggering the playbook?.

- A. Update.

- B. Link.
- C. Close.
- D. Drop.

Answer: B

Explanation:

Pre-process rules allow XSOAR to evaluate incoming events before they are fully created as incidents. These rules can suppress, modify, or relate events based on defined criteria. According to the Admin Guide, when a pre-process rule uses theLinkaction, XSOAR links the incoming event to an existing incident without triggering the standard incident creation process or subsequent playbook execution. This preserves the data for correlation and investigation while preventing duplicate or unnecessary playbook runs.

TheCloseaction (A) suppresses incidents completely and is used to auto-close unwanted events; this prevents preservation of the event and does not trigger the playbook. TheDropaction (C) discards incoming events entirely, removing them from the system and not preserving them. TheUpdateaction (B) modifies or enriches existing incidents but does not stop the playbook from running on newly created incidents of that type.

Because the requirement is to preserve the incident while also preventing automatic playbook execution, the Link action is the only workflow that fulfills both requirements according to XSOAR's pre-process rule architecture. Thus, option B is correct.

NEW QUESTION # 50

An engineer deployed two different instances of Active Directory for each organization site. As part of account enrichment use case, the engineer would like to delete a user from one specific site.

Which command will accomplish this?

- A. run 'ad-delete-user' command with 'user-dn' arg and ignore-outputs=true
- B. run 'ad-delete-user' command with 'user-dn' arg and using-brand="Active Directory Query v2"
- C. run 'ad-delete-user' command with 'user-dn' arg and raw-response=true
- D. run 'ad-delete-user' command with 'user-dn' arg and using="Active DirectoryQuery v2_instance_1"

Answer: D

NEW QUESTION # 51

A playbook needs to dynamically add an email sender's address to a Cortex XSOAR list named "BlockedSenders_Email."

Which built-in command should be used within the playbook to add this email address to the specified list?

- A. !createListItem listName="BlockedSenders_Email" itemValue="<email_address>".
- B. !addToList listName="BlockedSenders_Email" listData="<email_address>".
- C. !appendToListContext listPath="BlockedSenders_Email" data="<email_address>".
- D. !setIncident list.BlockedSenders_Email="<email_address>".

Answer: B

Explanation:

XSOAR's built-in Lists Services supports operations such as creating, updating, and appending items to lists using automation commands. The correct command for appending a value to an existing list is !addToList, which inserts the new string (in this case an email address) into the list array stored within the XSOAR Lists infrastructure.

The Admin Guide describes !addToList as the intended mechanism to add new elements to a named list while automatically handling JSON structure and avoiding duplication errors.

Option B, !appendToListContext, modifies context data, not persistent platform lists—therefore it will not update the BlockedSenders list. Option C misuses !setIncident, which updates incident fields only, not system lists. Option D, !createListItem, is used when an integration or automation script exposes a "create item" action, not for native XSOAR lists.

Thus, the correct and documented method of adding an email value to a persistent XSOAR list is !addToList, making option A the accurate choice.

NEW QUESTION # 52

Which two options will troubleshoot an integration's fetch incidents command? (Choose two.)

- A. execute !<integration_name>-fetch
- B. In the instance settings, enable the fetch incidents parameter and wait for one minute
- C. Create a one task playbook with a fetch-incident command
- D. execute !<integration_instance_name>-fetch

Answer: B,D

Explanation:
