CISSP Exam Preparation & Practice Questions

As technology continues to evolve, the need for skilled information security professionals has increased significantly. One of the most sought-after certifications in the field is the Certified Information Systems Security Professional (CISSP) certification. However, obtaining this certification requires significant preparation and dedication. In this article, we will explore the various aspects of CISSP Exam Practice Questions and provide tips to help you pass the exam. Additionally, we will discuss the importance of CISSP exam practice questions and live testing modules in preparing for the exam.

Understand the CISSP Exam Format

The CISSP exam is a computer-based test that consists of 250 multiple-choice questions. The exam is divided into eight domains, and candidates must demonstrate knowledge in each of these domains. To pass the exam, candidates must score at least 700 out of 1000. Understanding the format of the exam is critical to creating an effective study plan.

Create a Study Plan

Creating a study plan is essential to passing the CISSP exam. The exam covers a broad range of topics, and candidates must cover a lot of material. A study plan will help you organize your study time, track your progress, and ensure that you cover all the necessary topics. When creating your study plan, consider your work schedule, family commitments, and other activities that may affect your study time.

NEW QUESTION # 164

What is the term commonly used to refer to a technique of authenticating one machine to another by forging packets from a trusted source?

- A. Man-in-the-Middle (MITM) attack
- **B. Spoofing**
- C. Smurfing
- D. Session redirect

Answer: B

Explanation:

The term commonly used to refer to a technique of authenticating one machine to another by forging packets from a trusted source is spoofing. Spoofing is a type of attack that involves impersonating or masquerading as a legitimate entity, such as a user, a device, or a network, by altering or falsifying the source or destination address of a packet. Spoofing can be used to bypass authentication, gain unauthorized access, or launch other attacks, such as denial-of-service or man-in-the-middle. Man-in-the-middle, smurfing, and

session redirect are not terms that refer to a technique of authenticating one machine to another by forging packets from a trusted source, as they are related to different types of attacks or techniques. Man-in-the-middle is an attack that involves intercepting and modifying the communication between two parties. Smurfing is an attack that involves sending a large number of ICMP echo requests to a network broadcast address, using a spoofed source address of the intended victim. Session redirect is a technique that involves changing the destination address of a packet to redirect it to a different location. NEW QUESTION # 165

Which of the following is an example of a vulnerability of full-disk encryption (FDE)?

- A. Data at rest has been compromised when the user has authenticated to the device.
- B. Data in transit has been compromised when the user has authenticated to the device.
- C. Data on the device cannot be restored from backup.
- D. Data on the device cannot be backed up.

Answer: A

Explanation:

Full-disk encryption (FDE) is a security technique that encrypts the entire hard drive of a device or system, protecting the data at rest from unauthorized access, disclosure, or modification. However, FDE has a vulnerability that data at rest has been compromised when the user has authenticated to the device, which means that once the user enters the correct password or credentials to boot up the device or system, the data on the hard drive is decrypted and accessible to anyone who has physical access to the device or system, such as a thief or an attacker. This vulnerability can be exploited by using cold boot attacks, evil maid attacks, or other methods that target the device or system when it is powered on or in sleep mode. The other options are not examples of vulnerabilities of FDE, as FDE does not affect the ability to restore, backup, or transmit data.

NEW QUESTION # 166

The Lattice Based Access Control model was developed to deal mainly with _____ in computer systems.

- A. Information flow
- B. Access control
- C. Message routes
- D. Encryption

Answer: A

Explanation:

Information flow is clearly central to confidentiality but to some extent it also applies to integrity. The basic work in this area was done around 1970 and was driven mostly by the defense sector. Information flow in computer systems is concerned with flow from one security class (also called security label) to another. These controls are applied to objects. An object is a container of information, and an object can be a directory or file.
