Salesforce Identity-and-Access-Management-Architect Questions: Pass Exam With Good Scores [2026]

The valid updated, and real Prep4pass Identity-and-Access-Management-Architect questions and both practice test software are ready to download. Just take the best decision of your professional career and get registered in Salesforce Certified Identity and Access Management Architect Identity-and-Access-Management-Architect certification exam and start this journey with Prep4pass Identity-and-Access-Management-Architect Exam PDF dumps and practice test software. All types of Salesforce Identity-and-Access-Management-Architect Exam Questions formats are available at the affordable price.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q66-Q71):

NEW QUESTION # 66

Containers (UC) has implemented SAML-based single Sign-on for their Salesforce application and is planning to provide access to

Salesforce on mobile devices using the Salesforce1 mobile app. UC wants to ensure that Single Sign-on is used for accessing the Salesforce1 mobile App. Which two recommendations should the Architect make? Choose 2 Answers

- A. Configure the Salesforce1 App to use the MY Domain URL.
- B. Use the existing SAML-SSO flow along with User Agent Flow.
- C. Configure the Embedded Web Browser to use My Domain URL.
- D. Use the existing SAML SSO flow along with Web Server Flow.

Answer: A,B

Explanation:

To ensure that SSO is used for accessing the Salesforce1 mobile app, UC should configure the Salesforce1 app to use the My Domain URL instead of the default login.salesforce.com URL. My Domain is a feature that allows UC to create a custom domain name for their Salesforce org that supports SSO with their identity provider. UC should also use the existing SAML-SSO flow along with User Agent Flow, which is an OAuth

2.0 flow that allows users to authenticate with their identity provider through an embedded browser within the mobile app. Verified

NEW QUESTION # 67

An insurance company has a connected app in its Salesforce environment that is used to integrate with a Google Workspace (formerly known as G Suite).

An identity and access management (IAM) architect has been asked to implement automation to enable users, freeze/suspend users, disable users, and reactivate existing users in Google Workspace upon similar actions in Salesforce.

Which solution is recommended to meet this requirement?

- A. Update the Security Assertion Markup Language Just-in-Time (SAML JIT) handler in Salesforce for user provisioning and de-provisioning.
- B. Build a custom REST endpoint in Salesforce that Google Workspace can poll against.
- C. Build an Apex trigger on the userlogin object to make asynchronous callouts to Google APIs.
- D. Configure user Provisioning for Connected Apps.

Answer: D

NEW QUESTION # 68

Universal Containers (UC) uses Active Directory (AD) as their identity store for employees and must continue to do so for network access. UC is undergoing a major transformation program and moving all of their enterprise applications to cloud platforms including Salesforce, Workday, and SAP HANA. UC needs to implement an SSO solution for accessing all of the third-party cloud applications and the CIO is inclined to use Salesforce for all of their identity and access management needs.

Which two Salesforce license types does UC need for its employees'

Choose 2 answers

- A. Identity and Identity Connect licenses
- B. Chatter Only and Identity licenses
- C. Salesforce and Identity Connect licenses
- D. Company Community and Identity licenses

Answer: A,C

NEW QUESTION # 69

A third-party app provider would like to have users provisioned via a service endpoint before users access their app from Salesforce.

What should an identity architect recommend to configure the requirement with limited changes to the third-party app?

- A. Redirect users to the third-party app for registration.
- B. Use Salesforce identity with Security Assertion Markup Language (SAML) for provisioning users.
- C. Use a connected app with user provisioning flow.
- D. Create Canvas app in Salesforce for third-party app to provision users.

Answer: C

NEW QUESTION # 70

An Architect has configured a SAML-based SSO integration between Salesforce and an external Identity provider and is ready to test it. When the Architect attempts to log in to Salesforce using SSO, the Architect receives a SAML error. Which two optimal actions should the Architect take to troubleshoot the issue?

- A. Ensure the Callback URL is correctly set in the Connected Apps settings.
- **B. Use a browser that has an add-on/extension that can inspect SAML.**
- **C. Paste the SAML Assertion Validator in Salesforce.**
- D. Use the browser's Development tools to view the Salesforce page's markup.

Answer: B,C

Explanation:

these are the optimal actions to troubleshoot a SAML error. According to the Salesforce documentation¹, you can use the following methods to debug a SAML error:

* Use a browser that has an add-on/extension that can inspect SAML. This will allow you to see the SAML request and response messages and identify any issues with the SAML assertion or the SAML response².

* Paste the SAML Assertion Validator in Salesforce. This is a tool that helps you validate the last SAML operation on your organization and shows you any errors or warnings with the SAML assertion or the SAML response¹.

Option A is incorrect because the Callback URL is not related to SAML SSO. The Callback URL is used for OAuth SSO, which is a different protocol³. Option D is incorrect because using the browser's Development tools to view the Salesforce page's markup will not help you debug a SAML error. The page's markup does not contain any information about the SAML request or response⁴.
