Passing the Amazon AWS-Solutions-Architect-Associate certification exam is necessary for professional development, and employing real AWS-Solutions-Architect-Associate Exam Dumps can assist applicants in reaching their professional goals. These actual AWS-Solutions-Architect-Associate questions assist students in discovering areas in which they need improvement, boost confidence, and lower anxiety. Candidates will breeze through AWS Certified Solutions Architect - Associate (SAA-C03) (AWS-Solutions-Architect-Associate) certification examination with flying colors and advance to the next level of their jobs if they prepare with updated AWS-Solutions-Architect-Associate exam questions.

To prepare for the AWS-Solutions-Associate exam, candidates should have a solid understanding of AWS services and architecture, as well as hands-on experience using AWS services to design and deploy scalable systems. AWS offers a range of training courses and resources to help candidates prepare for the exam, including online courses, self-paced labs, and practice exams. Candidates can also take advantage of AWS certification communities and study groups to get support and advice from other AWS professionals.

The AWS-Solutions-Associate exam consists of multiple-choice questions that cover various topics related to AWS services, including EC2, S3, RDS, VPC, and others. AWS-Solutions-Architect-Associate exam duration is 130 minutes, and the passing score is 720 out of 1000. AWS-Solutions-Architect-Associate Exam is available in multiple languages, including English, Japanese, Korean, and Simplified Chinese.

### Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q312-Q317):

#### NEW QUESTION # 312

A company has asked a Solutions Architect to ensure that data is protected during data transfer to and from Amazon S3. Use of which service will protect the data in transit?

- A. SFTP
- **B. HTTPS**
- C. AWS KMS
- D. FTPS

**Answer: B**

Explanation:

#### NEW QUESTION # 313

A company designs a mobile app for its customers to upload photos to a website. The app needs a secure login with multi-factor authentication (MFA). The company wants to limit the initial build time and the maintenance of the solution. Which solution should a solutions architect recommend to meet these requirements?

- A. Edit IAM policies to require MFA for all users
- B. Federate IAM against the corporate Active Directory that requires MFA
- **C. Use Amazon Cognito Identity with SMS based MFA.**
- D. Use Amazon API Gateway and require server-side encryption (SSE) for photos

**Answer: C**

#### NEW QUESTION # 314

A company has a mobile chat application with a data store based in Amazon DynamoDB. Users would like new messages to be read with as little latency as possible. A solutions architect needs to design an optimal solution that requires minimal application changes. Which method should the solutions architect select?

- A. Double the number of read capacity units for the new messages table in DynamoDB. Continue to use the existing DynamoDB endpoint.
- **B. Configure Amazon DynamoDB Accelerator (DAX) for the new messages table. Update the code to use the DAX endpoint.**
- C. Add an Amazon ElastiCache for Redis cache to the application stack. Update the application to point to the Redis cache endpoint instead of DynamoDB.
- D. Add DynamoDB read replicas to handle the increased read load. Update the application to point to the read endpoint for the read replicas.

**Answer: B**

Explanation:

<https://aws.amazon.com/premiumsupport/knowledge-center/dynamodb-high-latency/> Amazon DynamoDB Accelerator (DAX) is a fully managed in-memory cache for DynamoDB that improves the performance of DynamoDB tables by up to 10 times and

provides microsecond level of response time at any scale. It is compatible with DynamoDB API operations and requires minimal code changes to use<sup>1</sup>. By configuring DAX for the new messages table, the solution can reduce the latency for reading new messages with minimal application changes.

B: Add DynamoDB read replicas to handle the increased read load. Update the application to point to the read endpoint for the read replicas. This solution will not work, as DynamoDB does not support read replicas as a feature. Read replicas are available for Amazon RDS, not for DynamoDB<sup>2</sup>.

C: Double the number of read capacity units for the new messages table in DynamoDB. Continue to use the existing DynamoDB endpoint. This solution will not meet the requirement of reading new messages with as little latency as possible, as increasing the read capacity units will only increase the throughput of DynamoDB, not the performance or latency<sup>3</sup>.

D: Add an Amazon ElastiCache for Redis cache to the application stack. Update the application to point to the Redis cache endpoint instead of DynamoDB. This solution will not meet the requirement of minimal application changes, as adding ElastiCache for Redis will require significant code changes to implement caching logic, such as querying cache first, updating cache after writing to DynamoDB, and invalidating cache when needed.

### NEW QUESTION # 315

A company wants to migrate an on-premises legacy application to AWS. The application ingests customer order files from an on-premises enterprise resource planning (ERP) system. The application then uploads the files to an SFTP server. The application uses a scheduled job that checks for order files every hour.

The company already has an AWS account that has connectivity to the on-premises network. The new application on AWS must support integration with the existing ERP system. The new application must be secure and resilient and must use the SFTP protocol to process orders from the ERP system immediately.

Which solution will meet these requirements?

- A. Create an AWS Transfer Family SFTP internal server in two Availability Zones. Use Amazon Elastic File System (Amazon EFS) storage. Create an AWS Step Functions state machine to process order files. Use Amazon EventBridge Scheduler to invoke the state machine to periodically check Amazon EFS for order files.
- B. Create an AWS Transfer Family SFTP internet-facing server in one Availability Zone. Use Amazon Elastic File System (Amazon EFS) storage. Create an AWS Lambda function to process order files. Use a Transfer Family managed workflow to invoke the Lambda function.
- C. Create an AWS Transfer Family SFTP internal server in two Availability Zones. Use Amazon S3 storage. Create an AWS Lambda function to process order files. Use a Transfer Family managed workflow to invoke the Lambda function.
- D. Create an AWS Transfer Family SFTP internet-facing server in two Availability Zones. Use Amazon S3 storage. Create an AWS Lambda function to process order files. Use S3 Event Notifications to send s3:ObjectCreated: \* events to the Lambda function.

**Answer: C**

Explanation:

This solution meets the requirements because it uses the following components and features:

**AWS Transfer Family SFTP internal server:** This allows the application to securely transfer order files from the on-premises ERP system to AWS using the SFTP protocol over a private connection. The internal server is deployed in two Availability Zones for high availability and fault tolerance.

**Amazon S3 storage:** This provides scalable, durable, and cost-effective object storage for the order files.

**Amazon S3** also supports encryption at rest and in transit, as well as lifecycle policies and versioning for data protection and compliance.

**AWS Lambda function:** This enables the application to process the order files in a serverless manner, without provisioning or managing servers. The Lambda function can perform any custom logic or transformation on the order files, such as validating, parsing, or enriching the data.

**Transfer Family managed workflow:** This simplifies the orchestration of the file processing tasks by triggering the Lambda function as soon as a file is uploaded to the SFTP server. The managed workflow also provides error handling, retry policies, and logging capabilities.

### NEW QUESTION # 316

A company is building a new dynamic ordering website. The company wants to minimize server maintenance and patching. The website must be highly available and must scale read and write capacity as quickly as possible to meet changes in user demand.

Which solution will meet these requirements?

- A. Host at the website content on Amazon EC2 instances Create an Auto Scaling group to scale the EC2 instances Use an Application Load Balancer to distribute traffic Use Amazon Aurora with Aurora Auto Scaling for the database
- B. Host static content in Amazon S3 Host dynamic content by using Amazon API Gateway and AWS Lambda Use Amazon Aurora with Aurora Auto Scaling for the database Configure Amazon CloudFront to deliver the website content
- C. Host static content in Amazon S3 Host dynamic content by using Amazon API Gateway and AWS Lambda Use Amazon DynamoDB with on-demand capacity for the database Configure Amazon CloudFront to deliver the website content
- D. Host al the website content on Amazon EC2 instances Create an Auto Scaling group to scale the EC2 Instances Use an Application Load Balancer to distribute traffic Use Amazon DynamoDB with provisioned write capacity for the database

**Answer: C**

Explanation:

Key phrase in the Question is must scale read and write capacity. Aurora is only for Read. Amazon DynamoDB has two read/write capacity modes for processing reads and writes on your tables: On-demand Provisioned (default, free-tier eligible)<https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/HowItWorks.ReadWriteCapacityMode.html>
