- B. FAT32
- C. NTFS
- D. Hierarchical File System Plus (HFS+)

Answer: D

Explanation:

Mac systems traditionally use the Hierarchical File System Plus (HFS+), which supports features such as journaling and metadata handling suited for Mac OS environments. Newer versions use APFS but HFS+ remains relevant.

* NTFS is primarily a Windows file system.

* EXT4 is a Linux file system.

* FAT32 is a generic cross-platform file system but lacks advanced features.

- D. Electronic Communications Privacy Act (ECPA)

Answer: B

NEW QUESTION # 57

An organization has identified a system breach and has collected volatile data from the system.

Which evidence type should be collected next?

- A. Running processes
- **B. Network connections**
- C. File timestamps
- D. Temporary data

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In incident response, after collecting volatile data (such as contents of RAM), the next priority is often to collect network-related evidence such as active network connections. Network connections can reveal ongoing communications, attacker activity, command and control channels, or data exfiltration paths.

* Running processes and temporary data are also volatile but typically collected simultaneously or immediately after volatile memory.

* File timestamps relate to non-volatile data and are collected later after volatile data acquisition to preserve evidence integrity.

* This sequence is supported by NIST SP 800-86 and SANS Incident Handler's Handbook which emphasize the volatility of evidence and recommend capturing network state immediately after memory.

* Data Doctor is primarily a data recovery tool, not specialized for mobile forensic imaging.

* Pwnage is related to jailbreaking iOS devices.
