NEW QUESTION # 124

A company has a two-tier application running on an Amazon EC2 server that handles all of its AWS based e-commerce activity. During peak times, the backend servers that process orders are overloaded with requests. This results in some orders failing to process. A developer needs to create a solution that will re-factor the application.

Which steps will allow for more flexibility during peak times, while still remaining cost-effective? (Select TWO.)

- **A. Migrate the backend servers to on-premises and pull from an Amazon SNS queue**
- B. Use an Amazon SNS queue to decouple the front-end and backend servers.
- C. Implement an Amazon SQS queue to decouple the front-end and backend servers
- **D. Increase the backend T2 EC2 instance size to xl to handle the largest possible load throughout the year**
- E. Modify the backend servers to pull from an Amazon SQS queue.

Answer: A,D

NEW QUESTION # 125

In regards to VPC, select the correct statement:

- A. You can associate multiple subnets with the same Route Table, but you can't associate a subnet with only one Route Table.
- B. None of these.
- **C. You can associate multiple subnets with the same Route Table.**
- D. You can't associate multiple subnets with the same Route Table.

Answer: C

Explanation:

Every subnet in your VPC must be associated with exactly one Route Table.

However, multiple subnets can be associated with the same Route Table.

NEW QUESTION # 126

Which one of the following statements is NOT an advantage of DyanamoDB being built on Solid State Drives:

- **A. high I/O performance of WebApp on EC2 instance**
- B. low-latency response times
- C. serve high-scale request workloads
- D. low request pricing

Answer: A

Explanation:

In DynamoDB, SSDs help achieve design goals of predictable low-latency response times for storing and accessing data at any scale. The high I/O performance of SSDs also enables to serve high-scale request workloads cost efficiently, and to pass this efficiency along in low request pricing.

NEW QUESTION # 127

A developer is designing a serverless application for a game in which users register and log in through a web browser. The application makes requests on behalf of users to a set of AWS Lambda functions that run behind an Amazon API Gateway HTTP API. The developer needs to implement a solution to register and log in users on the application's sign-in page. The solution must minimize operational overhead and must minimize ongoing management of user identities.

Which solution will meet these requirements'?

- A. Configure the sign-in page to register and store the users and their passwords in an Amazon DynamoDB table with an attached IAM policy.
- B. Program the sign-in page to create users' IAM groups with the IAM roles attached to the groups.
- **C. Create Amazon Cognito user pools for external social identity providers. Configure IAM roles for the identity pools.**
- D. Create an Amazon RDS for SQL Server DB instance to store the users and manage the permissions to the backend resources in AWS.

Answer: C

Explanation:

* Amazon Cognito User Pools: A managed user directory service, simplifying user registration and login.

* Social Identity Providers: Cognito supports integration with external providers (e.g., Google, Facebook), reducing development effort.

* IAM Roles for Authorization: Cognito-managed IAM roles grant fine-grained access to AWS resources (like Lambda functions).

* Operational Overhead: Cognito minimizes the need to manage user identities and credentials independently.
