Palo Alto Networks Certified Cybersecurity Practitioner Sample Questions (Q195-Q200):

NEW QUESTION # 195

How does Cortex XSOAR Threat Intelligence Management (TIM) provide relevant threat data to analysts?

- A. It prevents sensitive data from leaving the network.
- B. It performs SSL decryption to give visibility into user traffic.
- C. It creates an encrypted connection to the company's data center.
- **D. It automates the ingestion and aggregation of indicators.**

Answer: D

Explanation:

Cortex XSOAR Threat Intelligence Management (TIM) is a platform that enables security teams to manage the lifecycle of threat intelligence, from aggregation to action. One of the key features of Cortex XSOAR TIM is that it automates the ingestion and

aggregation of indicators from various sources, such as threat feeds, open-source intelligence, internal data, and third-party integrations 1. Indicators are pieces of information that can be used to identify malicious activity, such as IP addresses, domains, URLs, hashes, etc. By automating the ingestion and aggregation of indicators, Cortex XSOAR TIM reduces the manual effort and time required to collect, validate, and prioritize threat data. It also enables analysts to have a unified view of the global threat landscape and the impact of threats on their network 1. References: 1: Threat Intelligence Management

NEW QUESTION # 196

Which architecture model uses virtual machines (VMs) in a public cloud environment?

- A. Host-based
- B. Docker
- C. Serverless
- D. Kubernetes

Answer: A

Explanation:

A host-based architecture uses virtual machines (VMs) to run workloads on a shared host, commonly found in public cloud environments. Each VM operates independently with its own OS, making this model suitable for traditional and isolated application deployments.

NEW QUESTION # 197

What does "forensics" refer to in a Security Operations process?

- A. Collecting raw data needed to complete the detailed analysis of an investigation
- B. Analyzing new IDS/IPS platforms for an enterprise
- C. Reviewing information about a broad range of activities
- D. Validating cyber analysts' backgrounds before hiring

Answer: A

Explanation:

Forensics in a Security Operations process refers to collecting raw data needed to complete the detailed analysis of an investigation. Forensic analysis is a crucial step in identifying, investigating, and documenting the cause, course, and consequences of a security incident or violation. Forensic analysis involves various techniques and tools to extract, preserve, analyze, and present evidence in a structured and acceptable format.

Forensic analysis can be used for legal compliance, auditing, incident response, and threat intelligence purposes. References:

NEW QUESTION # 198

Why have software developers widely embraced the use of containers?

- A. Containers share application dependencies with other containers and with their host computer.
- B. Containers require separate development and production environments to promote authentic code.
- C. Containers are host specific and are not portable across different virtual machine hosts.
- D. Containers simplify the building and deploying of cloud native applications.

Answer: D

Explanation:

Containers are portable and lightweight alternatives to virtual machines that allow developers to package, isolate, and deploy applications across different cloud environments. Containers simplify the building and deploying of cloud native applications by providing consistent and efficient development, testing, and production environments. Containers also offer benefits such as rapid provisioning, high scalability, resource optimization, and security isolation. References:

NEW QUESTION # 199

Which Palo Alto Networks tool is used to prevent endpoint systems from running malware executables such as viruses, trojans, and rootkits?

- **A. Cortex XDR**
- B. AutoFocus
- C. App-ID
- D. Expedition

Answer: A

Explanation:

Cortex XDR is a cloud-based, advanced endpoint protection solution that combines multiple methods of prevention against known and unknown malware, ransomware, and exploits. Cortex XDR uses behavioral threat protection, exploit prevention, and local analysis to stop the execution of malicious programs before an endpoint can be compromised. Cortex XDR also enables remediation on the endpoint following an alert or investigation, giving administrators the option to isolate, terminate, block, or quarantine malicious files or processes. Cortex XDR is part of the Cortex platform, which provides unified visibility and detection across the network, endpoint, and cloud. References:
