## Palo Alto Networks XSIAM Analyst Sample Questions (Q92-Q97):

### NEW QUESTION # 92

In Cortex XSIAM, what initiates the execution of a playbook?

Response:

- A. Query Library hit
- B. SIEM log entry
- C. Alert correlation
- **D. Incident trigger or manual run**

**Answer: D**

### NEW QUESTION # 93

While investigating an incident on the Incident Overview page, an analyst notices that the playbook encountered an error. Upon playbook work plan review, it is determined that the error was caused by a timeout. However, the analyst does not have the necessary permissions to fix or create a new playbook.

Given the critical nature of the incident, what can the analyst do to ensure the playbook continues executing the remaining steps?

- A. Clone the playbook, remove the faulty step and run the new playbook to bypass the error
- B. Navigate to the step where the error occurred and run the task again
- **C. Pause the step with the error, thus automatically triggering the execution of the remaining steps.**
- D. Contact TAC to resolve the task error, as the playbook cannot proceed without it

**Answer: C**

Explanation:

The correct answer is D - Pause the step with the error, thus automatically triggering the execution of the remaining steps.

When a playbook encounters an error and the analyst does not have permissions to modify or recreate the playbook, the recommended action is to pause the step with the error. This will skip the problematic step and allow the remaining steps of the playbook to execute, ensuring the investigation or response continues.

"Pausing a failed step in the playbook work plan allows the remaining steps to continue executing, useful when immediate playbook edits are not possible due to permission restrictions." Document Reference: XSIAM Analyst ILT Lab Guide.pdf Page: Page 39 (Automation section)

### NEW QUESTION # 94

Which interval is the duration of time before an analytics detector can raise an alert?

- A. Test period
- B. Deduplication period
- **C. Training period**
- D. Activation period

**Answer: C**

Explanation:

The correct answer is C - Training period.

Analytics detectors within Cortex XSIAM utilize a training period to establish a baseline of normal behavior.

During this interval, the detector learns and identifies patterns and behaviors that are considered normal within the environment. Once the training period is complete, the detector can accurately detect and raise alerts on anomalies.

Other intervals mentioned do not match the definition:

\* Activation period: Refers to the time from activation to full functionality.

\* Test period: Typically refers to internal or manual testing stages.

\* Deduplication period: The time during which similar alerts are suppressed.

"Analytics detectors require an initial training period to learn normal patterns before being able to accurately raise alerts." Document

### NEW QUESTION # 95

Which type of analytics will trigger the alert on the image shown?

- A. Baseline
- B. Contextual
- C. Behavioral
- **D. Anomaly**

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The correct answer is D - Anomaly.

In Cortex XSIAM, Anomaly analytics are designed to trigger alerts when a monitored activity deviates significantly from the established baseline or historical average. In the image, the "Failed login by non-existent users on host" metric remains at zero for several days and then suddenly spikes to 267 and 381—far above the average threshold. This significant deviation from the established norm is identified by the analytics engine as an anomaly and will trigger an alert for further investigation.

"Anomaly analytics identify significant deviations from established baselines or averages, such as unusual spikes in failed login attempts or other behavioral outliers, and trigger alerts for potential threats." ### NEW QUESTION # 96

What is the primary function of hunting in Cortex XSIAM?

Response:

- A. Creating manual scoring policies
- B. Uploading endpoint profiles
- C. Performing backups
- **D. Searching for indicators across datasets**

**Answer: D**
