The second format Exam4Free also has a product support team available every time to help you out in any terms. And they will fix all of your problems on time. provides its users to study for Prepare for your Databricks Certified Data Engineer Associate Exam (Databricks-Certified-Data-Engineer-Associate) exam is web-based practice exam. This format has all the features of desktop practice exam software for Databricks Databricks-Certified-Data-Engineer-Associate exam preparation.

The GAQM Databricks-Certified-Data-Engineer-Associate Exam is a certification exam designed for data engineers who want to prove their proficiency in designing and building data pipelines using Databricks. The Databricks Certified Data Engineer Associate certification is highly valued in the data engineering industry and is recognized globally. Databricks Certified Data Engineer Associate Exam certification covers various topics related to data engineering, big data processing and analytics, and cloud computing using Databricks. Databricks Certified Data Engineer Associate Exam certification is ideal for data engineers who work with Databricks and want to advance their careers in data engineering.

Real Databricks-Certified-Data-Engineer-Associate Questions With Free Updates – Start Exam Preparation Today

Once you get the Databricks-Certified-Data-Engineer-Associate certificate, you can quickly quit your current job and then change a desirable job. The Databricks-Certified-Data-Engineer-Associate certificate can prove that you are a competent person. So it is easy for you to pass the interview and get the job. The assistance of our Databricks-Certified-Data-Engineer-Associate practice quiz will change your life a lot. As we can claim that if you study with our Databricks-Certified-Data-Engineer-Associate exam braindumps for 20 to 30 hours, you can pass the exam and get the certification with ease.

Databricks Certified Data Engineer Associate Exam Sample Questions (Q20-Q25):

NEW QUESTION # 20

Which of the following benefits is provided by the array functions from Spark SQL?

- A. An ability to work with data within certain partitions and windows
- B. An ability to work with an array of tables for procedural automation
- C. An ability to work with complex, nested data ingested from JSON files
- D. An ability to work with time-related data in specified intervals
- E. An ability to work with data in a variety of types at once

Answer: A

NEW QUESTION # 21

A data engineer has a Job that has a complex run schedule, and they want to transfer that schedule to other Jobs. Rather than manually selecting each value in the scheduling form in Databricks, which of the following tools can the data engineer use to represent and submit the schedule programmatically?

- A. Cron syntax
- B. There is no way to represent and submit this information programmatically
- C. `pyspark.sql.types.DateType`
- D. `pyspark.sql.types.TimestampType`
- E. `datetime`

Answer: A

NEW QUESTION # 22

A data engineer has a Job with multiple tasks that runs nightly. Each of the tasks runs slowly because the clusters take a long time to start.

Which of the following actions can the data engineer perform to improve the start up time for the clusters used for the Job?

- A. They can configure the clusters to autoscale for larger data sizes
- B. They can use endpoints available in Databricks SQL
- C. They can use jobs clusters instead of all-purpose clusters
- D. They can configure the clusters to be single-node
- E. They can use clusters that are from a cluster pool

Answer: E

Explanation:

The best action that the data engineer can perform to improve the start up time for the clusters used for the Job is to use clusters that are from a cluster pool. A cluster pool is a set of idle clusters that can be used by jobs or interactive sessions. By using a cluster pool, the data engineer can avoid the cluster creation time and reduce the latency of the tasks. Cluster pools also offer cost savings and resource efficiency, as they can be shared by multiple users and jobs.

Option A is not relevant, as endpoints available in Databricks SQL are used for creating and managing SQL analytics workloads, not for improving cluster start up time.

Option B is not correct, as jobs clusters and all-purpose clusters have similar start up times. Jobs clusters are clusters that are dedicated to run a single job and are terminated when the job is completed. All-purpose clusters are clusters that can be used for multiple purposes, such as interactive sessions, notebooks, or multiple jobs. Both types of clusters can benefit from using a cluster pool.

Option C is not advisable, as configuring the clusters to be single-node will reduce the parallelism and performance of the tasks. Single-node clusters are clusters that have only one worker node and are typically used for testing or development purposes. They are not suitable for running production jobs that require high scalability and fault tolerance.

Option E is not helpful, as configuring the clusters to autoscale for larger data sizes will not affect the start up time of the clusters. Autoscaling is a feature that allows clusters to dynamically adjust the number of worker nodes based on the workload. It can help optimize the resource utilization and cost efficiency of the clusters, but it does not speed up the cluster creation process.

NEW QUESTION # 23

A data engineer wants to create a new table containing the names of customers that live in France.

They have written the following command:

□ A senior data engineer mentions that it is organization policy to include a table property indicating that the new table includes personally identifiable information (PII).

Which of the following lines of code fills in the above blank to successfully complete the task?

- A. `TBLPROPERTIES PII`

- B. There is no way to indicate whether a table contains PII.
- **C. COMMENT "Contains PII"**
- D. "COMMENT PII"
- E. PII

Answer: C

Explanation:

In Databricks, when creating a table, you can add a comment to columns or the entire table to provide more information about the data it contains. In this case, since it's organization policy to indicate that the new table includes personally identifiable information (PII), option D is correct. The line of code would be added after defining the table structure and before closing with a semicolon.

NEW QUESTION # 24

A departing platform owner currently holds ownership of multiple catalogs and controls storage credentials and external locations. A data engineer has been asked to ensure continuity: transfer catalog ownership to the platform team group, delegate ongoing privilege management, and retain the ability to receive and share data via Delta Sharing.

Which role must be in place to perform these actions across the metastore?

- **A. Metastore Admin, because metastore admins can transfer ownership and manage privileges across all metastore objects, including shares and recipients.**
- B. Account Admin, because account admins can only create metastores but cannot change ownership of catalogs.
- C. Workspace Admin, because workspace admins can transfer ownership of any Unity Catalog object.
- D. Catalog Owner, because catalog owners can transfer any object in any catalog in the metastore.

Answer: A

Explanation:

Metastore Admins have the highest administrative privileges within a Unity Catalog metastore. They can transfer ownership of any Unity Catalog object, including catalogs, schemas, tables, storage credentials, and external locations. Metastore Admins are also required to manage Delta Sharing configurations such as creating or transferring shares and recipients.

Account Admins, by contrast, only create metastores and cannot change ownership or manage Delta Sharing objects. Workspace Admins have privileges limited to workspace-level management, not cross-metastore access.
