Practice 100-160 Mock - Latest 100-160 Test Fee

Our 100-160 study question is compiled and verified by the first-rate experts in the industry domestically and they are linked closely with the real exam. Our test bank provides all the questions which may appear in the real exam and all the important information about the exam. You can use the practice test software to test whether you have mastered the 100-160 Test Practice materials and

the function of stimulating the exam to be familiar with the real exam's pace. So our 100-160 exam questions are real-exam-based and convenient for the clients to prepare for the 100-160 exam.

Cisco Certified Support Technician (CCST) Cybersecurity Sample Questions (Q324-Q329):

NEW QUESTION # 324
Which of the following is an example of a source of evidence (artifact) in a cybersecurity investigation?

- A. Configuration files of network devices.
- B. Security policy documents.
- C. Training materials for security awareness.
- D. Firewall logs recording network traffic.

Answer: D

Explanation:
In a cybersecurity investigation, evidence or artifacts play a crucial role in determining the nature of an incident. Firewall logs recording network traffic can provide valuable information regarding communication between systems, including IP addresses, ports, protocols, and timestamps. Analyzing these logs can help identify potential threats or suspicious activities within a network.

NEW QUESTION # 325
Which command-line tool is used to query DNS records and obtain information about domain names?

- A. nslookup
- B. tcpdump
- C. traceroute
- D. netstat

Answer: A

Explanation:
The correct command-line tool for querying DNS records and obtaining information about domain names is nslookup. It can be used to check the security assessment information related to DNS configurations, verify the correct mapping of domain names to IP addresses, and troubleshoot any DNS-related issues.

NEW QUESTION # 326
Which of the following is an example of a passive vulnerability identification technique?

- A. Vulnerability scanning
- B. Intrusion detection system (IDS)
- C. Incident response
- D. Penetration testing

Answer: A

Explanation:
Vulnerability scanning is a passive technique used to identify vulnerabilities in a system or network. It involves the use of automated tools that scan the system for known vulnerabilities without actively exploiting them.

NEW QUESTION # 327
Which of the following best defines risk management in the context of cybersecurity?

- A. The process of identifying, assessing, and prioritizing vulnerabilities in an organization's networks and systems.
- B. The process of ensuring the confidentiality, integrity, and availability of an organization's information assets.
- C. The process of mitigating threats to an organization's information assets by implementing appropriate security controls.
- D. The process of analyzing potential threats and determining the likelihood and impact of those threats on an organization.

Answer: D

Explanation:
Risk management is the process of identifying, assessing, and prioritizing potential threats to an organization's information assets. By analyzing the likelihood and impact of these threats, organizations can make informed decisions on how to mitigate risks effectively. This process involves activities such as risk assessment, risk analysis, risk mitigation, and risk monitoring. The focus is on evaluating the probability and impact of potential cybersecurity incidents and implementing appropriate measures to reduce or eliminate these risks.

NEW QUESTION # 328
You are reviewing the Application log on a Windows computer. You see an event with an error-level message as shown.
What can you determine about the application that generated the event message?

- A. The application loaded and ran successfully without issues.
- B. The application recovered from an event without loss of functionality.
- C. The application is currently running much slower than expected.
- D. The application experienced a significant problem that caused it to fail.

Answer: D

Explanation:
In the CCST Cybersecurity course, Windows Event Viewer Error events in the Application log indicate a severe problem that caused an application or component to fail. This usually requires investigation or repair.
"Error events indicate a significant problem such as a loss of functionality in an application or system component. Errors are often critical and need immediate attention." (CCST Cybersecurity, Incident Handling, Event Logging and Analysis section, Cisco Networking Academy) A is incorrect: Performance slowness would usually generate warnings, not errors.
B is correct: An "Error" level in Event Viewer means the application failed in some way.
C is incorrect: That describes an "Information" event, not an error.
D is incorrect: That also corresponds to an "Information" event.

NEW QUESTION # 329
......

You may know that we are so popular for the passing rate of our 100-160 guide quiz is very high. Generally speaking, 98 % - 99 % of the users can successfully pass the 100-160 exam, obtaining the corresponding certificate. In addition, the content of our 100-160 Exam Materials is easy to learn and suitable for the public. No matter what your previous learning level is, there will be no problem of understanding.
