Salesforce Certified MuleSoft Developer II Sample Questions (Q31-Q36):

NEW QUESTION # 31

A healthcare customer wants to use hospital system data, which includes code that was developed using legacy tools and methods. The customer has created reusable Java libraries in order to read the data from the system.

What is the most effective way to develop an API retrieve the data from the hospital system?

- A. Include the libraries writes deploying the code into the runtime
- **B. Install libraries in a local repository and refer to it in the pom.xml file**
- C. Refer to JAR files in the code
- D. Create the Java code in your project and invoice the data from the code

Answer: B

Explanation:

To develop an API that retrieves data from a hospital system using reusable Java libraries, the developer should install libraries in a local repository and refer to it in the pom.xml file. This way, the developer can use Maven to manage dependencies and invoke Java code from Mule applications using Java Module operations. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/java-module-reference#add-the-java-module-to-your-project> <https://docs.mulesoft.com/mule-runtime/4.3/java-module-reference#invoke-java-code>

NEW QUESTION # 32

Multiple individual Mute application need to use the Mule Maven plugin to deploy to CloudHub.

The plugin configuration should .. reused where necessary and anything project, specific should be property-based.
Where should the Mule Maven details be configured?

- **A. A parent pom.xml**
- B. Pom, xml
- C. Settings, xml
- D. A Bill of Materials (BOM) parent pm

Answer: A

Explanation:

To reuse Mule Maven plugin configuration across multiple individual Mule applications, the developer should use a parent pom.xml file. A parent pom.xml file defines common configuration for one or more child projects that inherit from it. The developer can specify common properties and dependencies for all child projects in the parent pom.xml file, such as Mule Maven plugin configuration, and then reference them in each child project's pom.xml file using placeholders. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/mmp-concept#parent-pom> https://maven.apache.org/guides/introduction/introduction-to-the-pom.html#Project_Inheritance

NEW QUESTION # 33

A scatter-gather router is configured with four routes:Route A, B, C and D.
Route C false.

- A. Payload ['2']
- B. Payload failures['2']
- C. Error,errorMessage,payload.failures['2']
- **D. Error,errorMesage.payload.results ['2']**

Answer: D

Explanation:

The result of accessing route C failure is Error,errorMessage,payload.failures['2']. This is because a scatter-gather router returns an aggregated message that contains an array of results from each route and an array of failures from each route. The failures array contains error objects with information about each failed route execution. To access route C failure, which is the third route (index 2), the developer needs to use Error.errorMessage.payload.failures['2'] expression. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/scatter-gather-reference#scatter-gather-output>

NEW QUESTION # 34

Which type of cache invalidation does the Cache scope support without having to write any additional code?

- A. Notification-based invalidation
- **B. Time to live**
- C. White-behind invalidation
- D. Write-through invalidation

Answer: B

Explanation:

The Cache scope supports time to live (TTL) as a cache invalidation strategy without having to write any additional code. TTL specifies how long the cached response is valid before it expires and needs to be refreshed. The Cache scope also supports custom invalidation strategies using MEL or DataWeave expressions. Reference: https://docs.mulesoft.com/mule-runtime/4.3/cache-scope#cache_invalidation

NEW QUESTION # 35

An organization uses CloudHub to deploy all of its applications.

How can a common-global-handler flow be configured so that it can be reused across all of the organization's deployed applications?

- A. Create a Mule plugin project

Create a common-global-error-handler flow inside the plugin project.

Use this plugin as a dependency in all Mule applications.

Import that configuration file in Mule applications.

- B. Create a common-global-error-handler flow in all Mule Applications Refer to it flow-ref wherever needed.
- **C. Create a Mule Plugin project**

Answer: C

Explanation:

Create a common-global-error-handler flow inside the plugin project.

Use this plugin as a dependency in all Mule applications

D.

Create a Mule daman project.

Create a common-global-error-handler flow inside the domain project.

Use this domain project as a dependency.

Explanation:

To configure a common-global-handler flow that can be reused across all of the organization's deployed applications, the developer should create a Mule Plugin project, create a common-global-error-handler flow inside the plugin project, and use this plugin as a dependency in all Mule applications. This way, the developer can import the common-global-error-handler flow in any application that needs it and avoid duplicating the error handling logic. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/error-handling#global-error-handler>
