## Cisco Implementing Cisco Application Centric Infrastructure Sample Questions (Q129-Q134):

### NEW QUESTION # 129

Refer to the exhibit. An engineer wants to initiate an ICMP ping from Server1 to Server2. The requirement is for the BD1 to enforce ICMP replies that follow the expected path. The packets must be prevented from taking the direct path from Leaf1 to Server1. Which action must be taken on BD1 to meet these requirements?

- A. Disable Unicast Routing.
- B. Enable ARP Flooding.
- C. Set L2 Unknown Unicast to Flood.
- D. Set L2 Unknown Unicast to Hardware Proxy.

Answer: D

### NEW QUESTION # 130

Refer to the exhibit.

Refer to the exhibit. An engineer must allow IP mobility between Site1 and Site2 in a Cisco ACI Multi-Site orchestrator. The design must meet these requirements:

A disaster recovery (DR) solution must exist between the sites that do not require vMotion support.

The application must be started at a DR site without having to re-IP the application servers.

The solution must avoid any broadcast storms between the sites.

Which two actions meet these criteria? (Choose two.)

- A. Define a unique bridge domain subnet per site.
- B. Apply the L2 Stretch feature.
- C. Disable Inter-site BUM Traffic.
- D. Configure STP between Cisco ACI fabrics.
- E. Deploy a local EPG for Site1 and Site2.

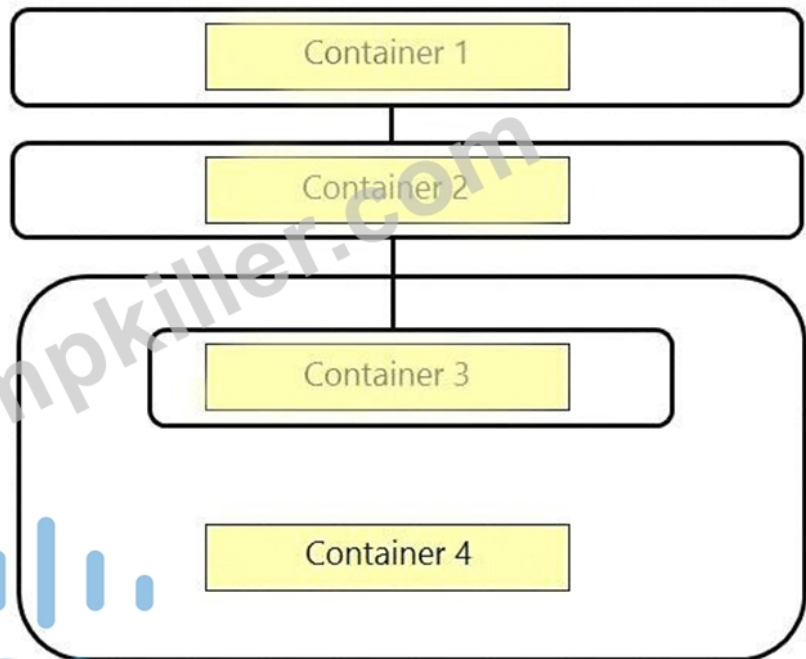

**Answer: A,E**

#### NEW QUESTION # 131

An engineer is configuring a VRF for a tenant named Cisco. Drag and drop the child objects on the left onto the correct containers on the right for this configuration.

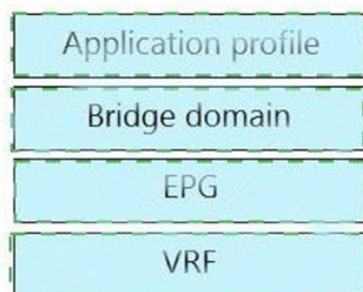

## Tenant Cisco

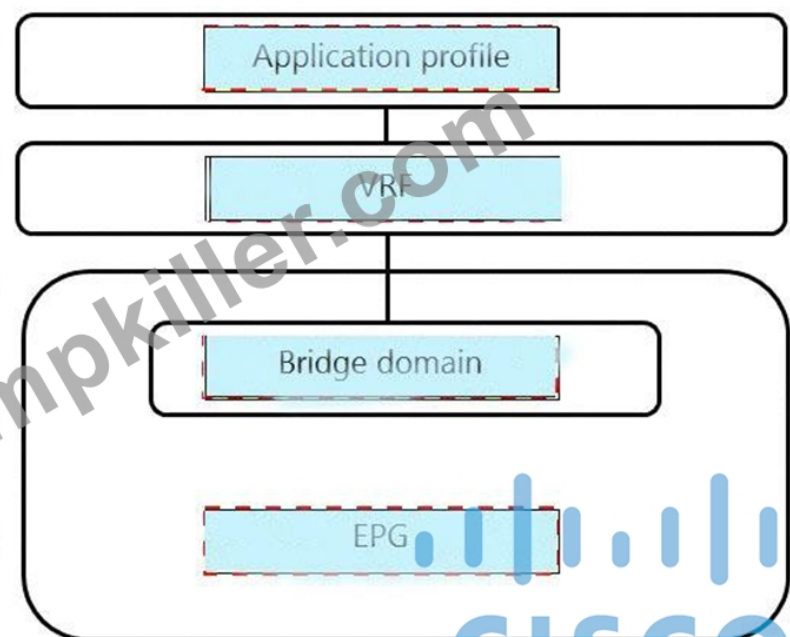

Answer:

Explanation:

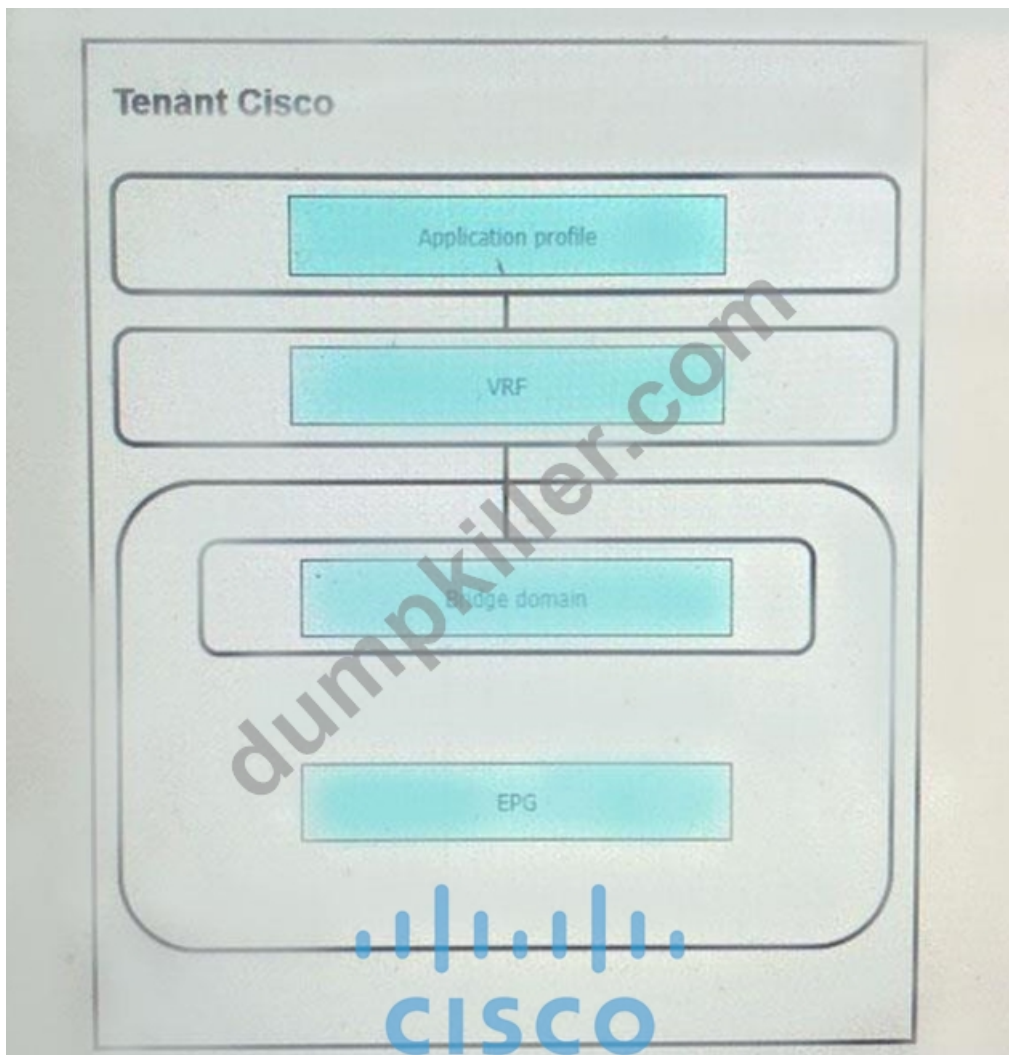

## Tenant Cisco

Explanation

Application profile---> VRF--> Bridge Domain--> EPG

#### NEW QUESTION # 132

What must be configured to redistribute externally learned OSPF routes within the ACI fabric?

- A. BGP Inter-leak Route Map
- B. Route Control Profile
- C. BGP Route Reflector
- D. PIM Sparse Mode

**Answer: C**

Explanation:

Once the border leaf learns the external routes, it can then redistribute the external routes of a given VRF instance to an MP-BGP address family (VPNv4 or VPNv6). MP-BGP maintains a separate BGP routing table for each VRF instance. Within MP-BGP, the border leaf switch advertises routes to a spine switch, which is a BGP route reflector. The routes are then propagated to all the leaf switches where the VRF instances are instantiated.

#### NEW QUESTION # 133

A network engineer must design a method to allow the Cisco ACI to redirect traffic to the firewalls.

Only traffic that matches specific L4-L7 policy rules should be redirected. The load must be distributed across multiple firewalls to scale the performance horizontally. Which action must be taken to meet these requirements?

- A. Configure ACI Service Graph with Unidirectional PBR.
- B. Implement ACI Service Graph with GPO.

- C. Configure ACI Service Graph with Symmetric PBR.
- D. Implement ACI Service Graph Two Nodes with GIPo.

**Answer: C**

**Explanation:**

### Requirements and design considerations

This section presents the requirements and design considerations for Cisco ACI PBR. Note that this document refers to a service graph device with the PBR feature as a PBR node, and it refers to a bridge domain that contains a PBR node interface as a PBR node bridge domain.

The main Cisco ACI PBR capabilities are as follows:

- PBR works with both physical and virtual service appliances.
- PBR works with service graphs in both managed mode (service-policy mode) and unmanaged mode (network-policy mode).
- PBR works with both bidirectional and unidirectional contracts.
- PBR can be used between L3Out EPGs and EPGs, between EPGs, and between L3Out EPGs.
- PBR is supported in Cisco ACI Multi-Pod, Multi-Site, and Remote Leaf environments.
- The load can be distributed across multiple L4-L7 devices (symmetric PBR).

The main use cases for Cisco ACI PBR are as follows:

- Use PBR to insert firewalls or load balancers in the path between endpoints while keeping the default gateway on the Cisco ACI fabric to use distributed routing.
- Use PBR to insert an L4-L7 device in the path between endpoints that are in the same subnet.
- Use PBR to send traffic selectively to L4-L7 devices based on protocol and port filtering.
- Use Symmetric PBR to horizontally scale the performance of L4-L7 devices.
