CrowdStrike Certified SIEM Engineer Sample Questions (Q54-Q59):

NEW QUESTION # 54

You notice a larger than expected ingest delay from one of your high-volume streaming log collectors. Which setting should you increase on the log collector to improve performance?

- A. Amount of available disk space
- B. Available source throughput
- C. Default memory queue size
- D. Number of concurrent requests a sink is using

Answer: D

Explanation:

The correct answer is C. Number of concurrent requests a sink is using .

CrowdStrike's Falcon LogScale Collector sizing guidance states that in high throughput scenarios where the ingestion endpoint becomes a bottleneck, it can be beneficial to increase the number of concurrent requests a sink is using through the workers setting. The docs explicitly say this helps when the number of parallel requests is limiting throughput.

The same document also explains why D is wrong: increasing the memory queue size does not increase sink throughput. The queue exists to keep data available for the sink; if throughput is lower than the incoming data rate, the queue will eventually fill up anyway.

So:

* C is correct because more sink workers can improve performance in high-volume conditions.

* D is incorrect because queue size does not fix the throughput bottleneck.

* A and B are not the documented tuning setting for this issue in the collector guidance.

NEW QUESTION # 55

What dashboard presents a view of third-party data ingestion over the past 30 days?

- **A. Next-Gen SIEM Connector Dashboard**
- B. Falcon Flex Dashboard
- C. Sensor Subscription Dashboard
- D. Sensor Usage Dashboard

Answer: A

Explanation:

The correct answer is A. Next-Gen SIEM Connector Dashboard .

CrowdStrike describes the Falcon Next-Gen SIEM Connector Dashboard as the place to understand the status and volume of data ingestion for third-party sources. This matches the question's requirement for a dashboard showing third-party ingestion visibility.

The other options are not aimed at third-party SIEM connector ingestion monitoring:

* Sensor Usage Dashboard relates to Falcon sensor usage, not connector-based third-party ingestion.

* Sensor Subscription Dashboard is about licensing/subscription counts.

* Falcon Flex Dashboard is related to subscription consumption and commercial usage, not connector ingestion telemetry.

NEW QUESTION # 56

How can you enable internal logging for a specific Falcon Log Collector instance from the Fleet view?

- A. Restart the collector service with the flag "Manage Internal Logging"
- B. Reinstall the collector with logging enabled
- C. Edit the local configuration file
- **D. Select "Manage Internal Logging" from the menu**

Answer: D

Explanation:

The correct answer is D. Select "Manage Internal Logging" from the menu .

CrowdStrike LogScale Collector documentation for Fleet Management explicitly describes the steps to enable internal logging from the Fleet view. It says to go to Data Ingest > Fleet Overview , click the ellipsis next to the specific collector instance, and then click Manage Internal Logging . From there, you can enable logging and choose where to send it.

Why the other options are incorrect:

A is incorrect because reinstalling the collector is not required. B is incorrect because the question specifically asks how to do it from the Fleet view , and the documented UI action is through the menu in Fleet Management, not by manually editing the local config. D

is incorrect because the documentation does not describe enabling internal logging by restarting the service with a special flag.

NEW QUESTION # 57

What is the primary benefit of utilizing Next-Gen SIEM's built-in dashboards?

- A. Custom queries for specific events
- B. Capability to modify dashboard source code

- C. Direct access to raw log data
- **D. Quick insights without manual setup**

Answer: D

Explanation:

The correct answer is C. Quick insights without manual setup .

CrowdStrike describes Falcon Next-Gen SIEM as providing pre-built dashboards and says teams can quickly understand security and system health with prebuilt dashboards for data collection health, SOAR workflow executions, security trends, and more. That directly supports the idea that the main benefit is getting fast visibility and insights without having to build everything manually first .

Why the other options are incorrect:

A is incorrect because dashboards are for visualization and insight, not primarily for raw log access. B is incorrect because custom queries are a separate search capability, not the main value proposition of built-in dashboards. D is incorrect because CrowdStrike emphasizes using pre-built and custom dashboards for visualization, not modifying dashboard source code as the primary benefit.

NEW QUESTION # 58

You need to ingest a data source into Next-Gen SIEM. There is a prebuilt Pull connector.

What is required to configure the connector?

- A. Falcon Log Collector hostname
- B. Falcon API URL
- C. HEC token
- **D. Data Source API key**

Answer: D

Explanation:

The correct answer is D. Data Source API key .

CrowdStrike's Next-Gen SIEM onboarding examples for prebuilt connectors show that, for pull-style integrations, you typically provide the API key generated in the external data source so Falcon Next-Gen SIEM can connect and start ingesting data. For example, CrowdStrike's Abnormal integration walkthrough says to enter the API key you generated , after which Falcon Next-Gen SIEM automatically connects and starts ingesting data.

Why the other options are incorrect:

- A). HEC token is used for HTTP Event Collector push-style ingestion, not for a prebuilt pull connector.
- B). Falcon Log Collector hostname is not the standard required credential for configuring a pull connector.
- C). Falcon API URL is not the key external credential typically required by these pull connectors.

For prebuilt pull connectors, the required configuration is generally the data source's API key or equivalent credential .
