CompTIA SecAI+ Certification Exam Sample Questions (Q80-Q85):

NEW QUESTION # 80

Which of the following requires developers to harden infrastructure to protect AI systems?

- A. Acceptable use policies
- B. Intake processes
- C. Configuration standards
- D. Development guidelines

Answer: C

Explanation:

Basic Concept: Infrastructure hardening for AI systems involves applying security baseline settings and eliminating unnecessary attack surfaces. CompTIA SecAI+ Exam Objectives identify configuration standards as the specific governance instrument that mandates infrastructure hardening requirements for AI deployments.

Why D is Correct: Configuration standards are formal, technical documents specifying exact security settings, baseline configurations, and hardening requirements that developers and administrators must implement to protect systems including AI

infrastructure. They establish enforceable rules such as disabling unnecessary services, applying least-privilege access, and enforcing secure communication protocols specifically for AI systems.

Why A is Wrong: Intake processes govern how new projects, systems, or requests are evaluated and onboarded into an organization. They are procedural checkpoints for initial assessment, not technical hardening directives for developers.

Why B is Wrong: Acceptable use policies define appropriate ways employees and users may use organizational systems and AI tools. They are behavioral guidelines aimed at end users, not technical requirements instructing developers to secure infrastructure.

Why C is Wrong: Development guidelines provide best practices and recommendations for software development and may include security considerations. However, they are advisory in nature and broader in scope than the specific mandatory infrastructure-hardening requirements found in configuration standards.

NEW QUESTION # 81

What control reduces the impact radius when a single host is compromised?

- A. Obfuscation
- B. Redaction
- C. Tokenization
- D. Network segmentation

Answer: D

Explanation:

Segmentation isolates systems and limits lateral movement.

NEW QUESTION # 82

An airline corporation wants to implement a chatbot application using a large language model (LLM) so its customers can ask questions and receive answers about flight details and have the option to upload files.

Which of the following security controls should the airline use to protect against malicious input and unauthorized use beyond the service-level agreement? (Choose two.)

- A. Role-based access controls
- B. Firewall rules
- C. Prompt guardrails
- D. Model token quotas

Answer: C,D

Explanation:

Basic Concept: LLM-based chatbots accepting user-uploaded files face two critical risk categories: malicious input injection and resource or cost abuse. CompTIA SecAI+ Study Guide highlights prompt security controls and resource management as key defensive layers for public-facing LLM applications.

Why A is Correct: Prompt guardrails intercept and filter user inputs and model outputs, blocking malicious prompts, prompt injection attempts, and harmful file content before affecting model behavior. Since users can upload files, guardrails are essential for sanitizing and validating that content before processing.

Why D is Correct: Model token quotas directly limit how much of the LLM's processing capacity a user can consume. This prevents abuse beyond the SLA, including denial-of-wallet attacks or resource exhaustion through excessively large inputs or repeated requests.

Why B is Wrong: Role-based access controls manage who can access what resources. While useful for internal systems, they do not address malicious input content or enforce LLM resource consumption limits for a public-facing chatbot.

Why C is Wrong: Firewall rules operate at the network layer and can block unauthorized IPs or ports but cannot inspect or filter the semantic content of prompts or control token-level LLM usage.

NEW QUESTION # 83

Which of the following is used to train an AI model with unstructured data?

- A. Fine-tuning
- B. Statistical learning
- C. Supervised learning

- D. Reinforcement training

Answer: A

Explanation:

Fine-tuning allows an AI model to adapt to unstructured data (such as text, audio, or images) by retraining it on domain-specific datasets. This process improves the model's ability to handle and generate outputs aligned with the unstructured data context.

NEW QUESTION # 84

A security analyst finds that the AI system is under a denial-of-wallet attack. Which of the following should the analyst enforce to protect the company? (Choose two.)

- A. Model fine-tuning
- B. Endpoint access controls
- **C. Application programming interface (API) rate controls**
- D. Modality controls
- E. Content delivery network (CDN)
- **F. Output token controls**

Answer: C,F

Explanation:

API rate controls limit the number of requests within a set timeframe, preventing attackers from overloading the system and driving up costs.

Output token controls restrict the length of responses, reducing unnecessary token usage that attackers might exploit in a denial-of-wallet attack.

NEW QUESTION # 85
