Free PDF Quiz 2026 Lpi 010-160: High Pass-Rate Linux Essentials Certificate Exam - version 1.6 Book Free

The third format of SurePassExams product is the desktop Lpi 010-160 practice exam software. You can access the Linux Essentials Certificate Exam - version 1.6 (010-160) practice exam after installing this software on your Windows computer or laptop. Specifications we have discussed in the paragraph of the web-based version are available in desktop 010-160 Practice Exam software.

Obtaining the Linux Essentials certification can help IT professionals stand out in the job market and demonstrate their understanding of Linux and open-source software. It is also a great first step towards more advanced Linux certifications, such as the LPIC-1 or the CompTIA Linux+.

Lpi Linux Essentials Certificate Exam - version 1.6 Sample Questions (Q25-Q30):

NEW QUESTION # 25

What are the differences between hard disk drives and solid state disks? (Choose two correct answers.)

- **A. Solid state disks provide faster access to stored data than hard disks.**
- B. Hard disks can fail due to physical damage, while solid state disks cannot fail.
- C. Solid state disks can store many times as much data as hard disk drives.
- D. /dev/sda is a hard disk device while /dev/ssda is a solid state disk.
- **E. Hard disks have a motor and moving parts, solid state disks do not.**

Answer: A,E

Explanation:

The main difference between hard disk drives (HDDs) and solid state drives (SSDs) is the way they store and access data. HDDs use a spinning disk (platter) and a moving head to read and write data, while SSDs use flash memory chips that have no moving parts. This makes SSDs faster, quieter, and more durable than HDDs, but also more expensive and less spacious. HDDs and SSDs are both I/O devices that can be used to boot the system and store data, but they have different advantages and disadvantages depending on the use case. Reference:

NEW QUESTION # 26

Which statements about the directory /etc/skel are correct? (Choose two.)

- A. The personal user settings of root are stored in this directory.
- B. The directory contains the global settings for the Linux system.
- C. The files from the directory are copied to the home directory of the new user when starting the system.
- **D. The files from the directory are copied to the home directory of a new user when the account is created.**
- **E. The directory contains a default set of configuration files used by the useradd command.**

Answer: D,E

Explanation:

The /etc/skel directory is a skeleton directory that contains the default files and directories that are automatically copied to the home directory of a new user when the account is created by the useradd command¹². The purpose of this directory is to provide a consistent and uniform environment for all new users and to save the system administrator's time and effort in configuring the user settings¹². The /etc/skel directory can be customized by adding or removing files and directories as needed, depending on the desired default settings for the new users¹².

The other options are incorrect because:

A. The personal user settings of root are stored in this directory. This is not true, as the personal user settings of root are stored in the /root directory, which is the home directory of the root user³. The /etc/skel directory does not affect the root user's settings, but only the settings of the new users created by the useradd command¹².

B. The files from the directory are copied to the home directory of the new user when starting the system. This is not true, as the files from the directory are copied to the home directory of the new user when the account is created, not when starting the system¹². The copying process only happens once, when the useradd command is executed, and not every time the system is started¹².

E. The directory contains the global settings for the Linux system. This is not true, as the directory contains the default settings for the new users, not the global settings for the Linux system¹². The global settings for the Linux system are usually stored in other directories under /etc, such as /etc/default, /etc/sysconfig, /etc/init.d, etc⁴.

NEW QUESTION # 27

Which of the following tasks can the command passwd accomplish? (Choose two.)

- **A. Lock a user account.**

- B. Create a new user account.
- C. Create a new user group.
- D. Change a user's username.
- E. Change a user's password.

Answer: A,E

Explanation:

Explanation

The passwd command in Linux is used to change the password of a user account. A normal user can run passwd to change their own password, and a system administrator (the superuser) can use passwd to change another user's password, or define how that account's password can be used or changed¹. The passwd command can also be used to lock or unlock a user account. Locking a user account means disabling the user's ability to log in to the system, while unlocking a user account means restoring the user's ability to log in. To lock a user account, the passwd command can be used with the -l option, followed by the username. To unlock a user account, the passwd command can be used with the -u option, followed by the username². The passwd command cannot be used to change a user's username, create a new user account, or create a new user group. These tasks require different commands, such as usermod, useradd, or groupadd^{3,4,5}. References: 1:

NEW QUESTION # 28

The current directory contains the following file:

```
-rw-r-r- 1 root exec 24551 Apr 2 12:36 test.sh
```

The file contains a valid shell script, but executing this file using ./test.sh leads to this error:

```
bash: ./test.sh: Permission denied
```

What should be done in order to successfully execute the script?

- A. The execute bit should be set in the file's permissions.
- B. The user executing the script should be added to the execgroup.
- C. The file's extension should be changed from .sh to .bin.
- D. The script should be run using #!./test.sh instead of ./test.sh.
- E. The SetUID bit should be set in the file's permissions.

Answer: A

NEW QUESTION # 29

Most commands on Linux can display information on their usage. How can this information typically be displayed?

- A. By running the command with the option ?! or ?=!.
- B. By running the command with the option /? or /??.
- C. By running the command with the option /doc or /documentation.
- D. By running the command with the option -h or --help.
- E. By running the command with the option -m or --manpage.

Answer: D

Explanation:

Explanation

Most commands on Linux can display information on their usage by running the command with the option -h or --help. This option shows a brief summary of the command syntax, options, arguments, and examples. For example, running ls -h or ls --help will display the usage information for the ls command, which lists files and directories. The -h or --help option is a standard convention for most Linux commands, and it is useful for learning how to use a command or checking its available options. However, some commands may not support this option, or may use a different option to display usage information. In that case, you can use the man command to access the manual page for the command, which provides more detailed information on the command usage, description, options, arguments, examples, and references. For example, running man ls will display the manual page for the ls command. The man command is one of the applications covered in the Linux Essentials certification program from the Linux Professional Institute (LPI). References:
