

C_S4EWM_2601 Valid Test Forum, Testking C_S4EWM_2601 Exam Questions

We offer you free update for one year if you buy C_S4EWM_2601 study guide materials from us, that is to say, in the following year, you can obtain the latest information about the C_S4EWM_2601 study materials for free. In addition, with the experienced experts to compile, C_S4EWM_2601 exam dumps is high-quality, and it contain most of knowledge points of the exam, and you can also improve your ability in the process of learning. C_S4EWM_2601 Exam Dumps of us have received many good feedbacks from our customers, they thanks us for helping them pass the exam successfully.

SAP C_S4EWM_2601 Exam Syllabus Topics:

Section	Objectives
Topic 1: System Integration and Automation	- Material flow system (MFS) integration - RF framework and mobile data entry
Topic 2: Monitoring and Exception Handling	- Warehouse monitoring tools - Exception handling and alerts
Topic 3: Warehouse Structure and Master Data	- Business partners and product master data in EWM - Storage types, sections, and bins
Topic 4: Overview of SAP S/4HANA Embedded Extended Warehouse Management	- Warehouse management fundamentals - Architecture and integration with SAP S/4HANA
Topic 5: Inbound Processing	- Goods receipt and inbound delivery processing - Putaway strategies and warehouse task creation
Topic 6: Outbound Processing	- Outbound delivery and picking strategies - Packing and goods issue processes
Topic 7: Warehouse Processes and Optimization	- Labor management basics - Wave management and slotting

C_S4EWM_2601 valid torrent & C_S4EWM_2601 latest vce & C_S4EWM_2601 exam guide

SAP certification is recognized by all companies of most countries in the world. If you get this certification you have a space in IT

field all over the world. If you are still headache about your C_S4EWM_2601, our C_S4EWM_2601 valid exam learning materials will be a good choice for you. DumpsMaterials releases valid exam learning materials for IT exam. Purchasing our C_S4EWM_2601 valid exam learning materials will make you get double results with half the work. Why not to buy?

SAP Certified - SAP S/4HANA Cloud Private Edition, Extended Warehouse Management Sample Questions (Q104-Q109):

NEW QUESTION # 104

CHALLENGE 2; Line-Down Reservation Release for Production Support The warehouse team proposes a release variant that makes planned maintenance kits visible earlier but keeps line-down requests ahead in the mobile queue. The rollout lead asks what evidence should be checked before using it in cutover readiness.

Which evidence best supports accepting the release variant?

Response:

- A. The release variant is applied only by the most experienced shift lead during cutover testing.
- **B. Line-down dispatch staging remains protected while planned kits release only inside the validated queue-capacity window.**
- C. Planned kits are released first so the warehouse can clear predictable work before urgent requests arrive.
- D. Planned kit task count increases, and supervisors report that the workload is easier to see.

Answer: B

Explanation:

Feedback:

This evidence connects the release variant to the required dependency chain: urgency, queue capacity, and dispatch readiness. It supports performance visibility without sacrificing governed priority handling.

NEW QUESTION # 105

An industrial seals distributor is validating outbound packing eligibility in SAP S/4HANA Extended Warehouse Management through a web-based private-edition environment. Outbound deliveries are transferred successfully, wave release completes, and picking tasks are created and confirmed without issue. For deliveries assigned to one packaging-instruction profile, the monitor shows picked status and completed warehouse orders, but the deliveries never become eligible for the expected packing work center step. Deliveries using other packaging-instruction profiles in the same shipping cycle proceed normally. A warehouse lead proposes starting manual packing for the affected deliveries so the dispatch cut-off is still met. The consultant must remove the recurring upstream cause and avoid a manual action that only corrects the current symptom.

Which action should the consultant perform first?

Response:

- **A. heck whether the affected packaging-instruction context is correctly linked to the outbound follow-on determination after picking confirmation.**
- B. ncrease labor at the packing work center so the affected deliveries can be handled within the same shipping window.
- C. ontinue manual packing for the affected deliveries until the next configuration transport is available.
- D. educe the number of deliveries in each release cycle so the affected profile is processed in a smaller batch.

Answer: A

Explanation:

Feedback:

The observable artifact is a downstream eligibility exclusion after successful picking. Since transfer, wave release, task creation, and confirmation all work, the issue does not sit in initial outbound execution. Because only one packaging-instruction context fails, the most likely root cause is missing or incorrect follow-on determination for that outbound condition after picking confirmation.

NEW QUESTION # 106

A manufacturer is testing inbound processing in SAP S/4HANA Extended Warehouse Management after basic customizing was transported to a quality tenant in a web-based private-edition environment. The inbound delivery is distributed correctly, and warehouse tasks are created for putaway. However, during execution the user receives a message that the destination bin cannot be determined for one product group, while other products in the same delivery complete successfully. The affected materials were recently added to the warehouse and use the same storage type as similar products already working in test.

The business wants a targeted correction with minimal change risk because the current configuration already supports most inbound

flows. The consultant must choose the action that best explains and resolves the selective failure without unnecessarily redesigning the full putaway process.

What is the best next action?

Response:

- A. Recreate the warehouse order creation rule so the system can regroup tasks before determining the final destination.
- **B. Check whether the affected products are missing the storage section or putaway-relevant master data used by bin determination.**
- C. Change the goods receipt posting sequence so bin determination occurs only after manual confirmation of the delivery.
- D. Replace the inbound process type with a more generic one so all product groups use the same simplified logic.

Answer: B

Explanation:

Feedback:

The issue is selective: some products in the same inbound delivery work, and others do not. That strongly indicates that the shared process configuration is mostly correct, while product-specific determination data is incomplete. In EWM, destination-bin logic often depends on product- and storage-related master data such as putaway-relevant settings or section determination inputs. Because warehouse tasks are already being created, the upstream process type determination is functioning. The most precise next step is to validate product-specific data used in destination determination.

NEW QUESTION # 107

CHALLENGE 1; Temperature-Zone Putaway Determination During Inbound Receipt During inbound testing, palletized chilled goods are received successfully and warehouse tasks are created. The receiving team notices that some pallets follow a generic putaway path, while manually corrected tasks reach the intended temperature-controlled area. Which action best validates the likely configuration dependency before changing execution behavior?

Response:

- **A. Review the receipt-driven determination sequence for warehouse structure, process type, and putaway destination before confirming further tests.**
- B. Move the affected products into a temporary storage area and defer putaway validation until after the first warehouse go-live.
- C. Increase manual task correction authority for receiving supervisors so each chilled receipt can be redirected during testing.
- D. Adjust outbound wave criteria first because later picking delays may be caused by the same warehouse activity area setup.

Answer: A

Explanation:

Feedback:

The scenario shows that goods receipt and task creation are technically working, but the automatically determined destination does not consistently reflect the intended chilled flow. Reviewing the warehouse structure, process type, and putaway determination sequence validates the second-order dependency behind repeatable task behavior.

NEW QUESTION # 108

CHALLENGE 4; Shared Template Classification for Refrigerated Hub Rollout A release setting improves urgent supermarket visibility at the pilot hub, but the rollout team is unsure whether it will overload smaller refrigerated hubs.

Which decision best reflects lifecycle-aware template control?

Response:

- A. Remove the setting immediately because any local setting creates unacceptable lifecycle divergence.
- B. Apply the setting everywhere because improved pilot visibility proves refrigerated rollout readiness.
- **C. Keep the setting only after documenting whether it is reusable template behavior or an approved pilot-specific variation.**
- D. Let each refrigerated hub decide independently during activation to reduce central governance effort.

Answer: C

Explanation:

Feedback:

The decision preserves the improvement while requiring lifecycle classification. Documenting reusable or pilot-specific status protects the shared template without blocking valid SIT refinement.

NEW QUESTION # 109
