CompTIA A+ Core 1 Exam (2026) Sample Questions (Q109-Q114):

NEW QUESTION # 109

A security team wants to implement compliance controls that only permits the installation of company- approved software on user laptops. Which of the following should the IT department deploy?

- A. MDM
- B. SaaS
- C. EDR
- D. VPN

Answer: A

Explanation:

Mobile Device Management (MDM) allows IT departments to enforce compliance controls, such as restricting the installation of unapproved software, on laptops and mobile devices.

Why Not A (EDR): Endpoint Detection and Response focuses on detecting and mitigating security threats, not compliance controls.

Why Not B (VPN): Virtual Private Networks provide secure connections but do not enforce software installation policies.

Why Not D (SaaS): Software as a Service refers to software delivery models and does not enforce compliance controls.

CompTIA A+ Exam Reference: Core 2 (220-1102), Section 2.7, device management and security.

NEW QUESTION # 110

Which of the following virtualization technologies is best suited for running microservices?

- A. Type 1 hypervisors
- B. VDI
- C. Containers
- D. Type 2 hypervisors

Answer: C

Explanation:

Containers provide lightweight virtualization, ideal for deploying microservices because they are isolated, portable, and require fewer resources than traditional VMs.

NEW QUESTION # 111

A shared printer experiences an outage when users submit numerous print jobs at the same time. Which of the following will an engineer most likely do after verifying network connectivity?

- A. Reset the printer to factory settings.
- B. Reinstall the printer drivers.
- C. Reboot the server.
- D. Restart the spooler service.

Answer: D

Explanation:

In networked print environments, print jobs are processed through a system service called the print spooler. CompTIA A+ stresses that when shared printers fail due to job overload, the problem often lies with a hung or overloaded spooler service, especially when multiple jobs are sent simultaneously. The spooler queues, organizes, and processes print jobs; if it becomes overwhelmed or corrupted, printing stops completely even though the network and printer hardware remain functional.

After verifying network connectivity-as the question states- the next logical and CompTIA-aligned troubleshooting step is to restart the spooler service (D). Restarting it clears stuck or corrupt jobs, reinitializes print processing, and restores functionality without requiring a full server reboot or reinstallation of drivers.

Rebooting the server (A) may work but is unnecessarily disruptive and affects multiple services. Reinstalling printer drivers (B) is only warranted for driver corruption issues and is not the first step for spooler congestion. Resetting the printer to factory defaults

(C) erases settings and is far too drastic for a simple print queue issue.

Therefore, the most efficient and technically correct action is restarting the print spooler service, restoring printing immediately while maintaining normal server operations.

NEW QUESTION # 112

A user prints a spreadsheet in duplex mode. The spreadsheet is difficult to read because some of the columns spill onto the second side of the page. Which of the following should the user do to prevent the issue but still print on both sides of the page?

- A. Use a different print driver.
- B. Turn off duplex printing.
- C. Try a smaller font size in the spreadsheet.
- **D. Change the page orientation.**

Answer: D

Explanation:

Changing the page orientation(e.g., from portrait to landscape) allows wider columns to fit on one side of the page. This maintains readability while continuing to use duplex printing.

Option A:Disabling duplex defeats the goal of printing on both sides.

Option B:May help, but could make the document harder to read if the font is too small.

Option D:Unlikely to resolve formatting issues related to layout and dimensions.

CompTIA A+ Core 1 Exam Objective Reference:

Objective 3.7: Given a scenario, troubleshoot common printer problems.

NEW QUESTION # 113

A user asks a technician for assistance with a printer that has stopped printing. The user states that the print jobs are generated from a website and are difficult to re-create. When the technician remotes into the user's computer, they can see many jobs in the queue. The issue persists after the user performs a hard reset of the printer. Which of the following will most likely fix the issue?

- A. Deleting all the jobs and having the user restart their computer
- **B. Restarting the print spooler service on the local computer**
- C. Making sure the printer is using the latest PCL driver
- D. Updating the manufacturer's firmware on the printer

Answer: B

Explanation:

Restarting the print spooler service clears and reloads the print queue on the user's PC, removing any hung jobs without needing to recreate or reprint them.
