## AWS-Solutions-Architect-Associate Flexible Testing Engine & AWS-Solutions-Architect-Associate Regular Update

The AWS Certified Solutions Architect - Associate (SAA-C03) certification exam is one of the top-rated career advancement certification exams. The Amazon AWS-Solutions-Architect-Associate certification exam can play a significant role in career success. With the AWS Certified Solutions Architect - Associate (SAA-C03) (AWS-Solutions-Architect-Associate) certification, you can gain several benefits such as validation of skills, career advancement, competitive advantage, continuing education, and global recognition of your skills and knowledge.

The AWS Certified Solutions Architect - Associate (SAA-C02) exam is a certification offered by Amazon Web Services (AWS) for individuals who want to validate their knowledge and skills in designing and deploying scalable, highly available, and fault-tolerant systems on AWS. AWS-Solutions-Architect-Associate Exam is intended for professionals who have experience working with AWS and are responsible for designing and implementing solutions on the platform.

## Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q325-Q330):

### NEW QUESTION # 325

A company is managing health records on-premises. The company must keep these records indefinitely, disable any modifications to the records once they are stored, and granularly audit access at all levels. The chief technology officer (CTO) is concerned because there are already millions of records not being used by any application, and the current infrastructure is running out of space. The CTO has requested a solutions architect design a solution to move existing data and support future records.

Which services can the solutions architect recommend to meet these requirements?

- A. Use AWS Storage Gateway to move existing data to AWS. Use Amazon S3 to store existing and new data. Enable Amazon S3 object lock and enable AWS CloudTrail with management events.
- B. Use AWS DataSync to move existing data to AWS. Use Amazon S3 to store existing and new data. Enable Amazon S3

object lock and enable AWS CloudTrail with data events.

- C. Use AWS DataSync to move existing data to AWS. Use Amazon S3 to store existing and new data. Enable Amazon S3 object lock and enable AWS CloudTrail with management events.
- D. Use AWS Storage Gateway to move existing data to AWS. Use Amazon Elastic Block Store (Amazon EBS) to store existing and new data. Enable Amazon S3 object lock and enable Amazon S3 server access logging.

**Answer: B**

#### NEW QUESTION # 326

A company's production application runs online transaction processing (OLTP) transactions on an Amazon RDS MySQL DB instance. The company is launching a new reporting tool that will access the same data. The reporting tool must be highly available and not impact the performance of the production application.

How can this be achieved?

- A. Create multiple RDS Read Replicas of the production RDS DB instance. Place the Read Replicas in an Auto Scaling group.
- **B. Create a Multi-AZ RDS Read Replica of the production RDS DB instance.**
- C. Create hourly snapshots of the production RDS DB instance.
- D. Create a Single-AZ RDS Read Replica of the production RDS DB instance. Create a second Single-AZ RDS Read Replica from the replica.

**Answer: B**

Explanation:

<https://aws.amazon.com/blogs/database/best-storage-practices-for-running-production-workloadson-hosted-datab> Amazon RDS Read Replicas Now Support Multi-AZ Deployments Amazon RDS Read Replicas enable you to create one or more read-only copies of your database instance within the same AWS Region or in a different AWS Region. Updates made to the source database are then asynchronously copied to your Read Replicas. In addition to providing scalability for read-heavy workloads, Read Replicas can be promoted to become a standalone database instance when needed.

Amazon RDS Multi-AZ deployments provide enhanced availability for database instances within a single AWS Region. With Multi-AZ, your data is synchronously replicated to a standby in a different Availability Zone (AZ). In the event of an infrastructure failure, Amazon RDS performs an automatic failover to the standby, minimizing disruption to your applications.

You can now use Read Replicas with Multi-AZ as part of a disaster recovery (DR) strategy for your production databases. A well-designed and tested DR plan is critical for maintaining business continuity after a disaster. A Read Replica in a different region than the source database can be used as a standby database and promoted to become the new production database in case of a regional disruption.

#### NEW QUESTION # 327

Developers are creating a new online transaction processing (OLTP) application for a small database that is very read-write intensive. A single table in the database is updated continuously throughout the day, and the developers want to ensure that the database performance is consistent.

Which Amazon EBS storage option will achieve the MOST consistent performance to help maintain application performance?

- A. Cold HDD
- B. General Purpose SSD
- **C. Provisioned IOPS SSD**
- D. Throughput Optimized HDD

**Answer: C**

#### NEW QUESTION # 328

What should a solutions architect do to ensure that all objects uploaded to an Amazon S3 bucket are encrypted?

- **A. Update the bucket policy to deny if the PutObject does not have an x-amz-server-side-encryption header set.**
- B. Update the bucket policy to deny if the PutObject does not have an aws:SecureTransport header set to true.

- C. Update the bucket policy to deny if the PutObject does not have an s3:x-amz-acl header set to private.
- D. Update the bucket policy to deny if the PutObject does not have an s3:x-amz-acl header set.

**Answer: A**

### NEW QUESTION # 329

You have a video transcoding application running on Amazon EC2. Each instance polls a queue to find out which video should be transcoded, and then runs a transcoding process. If this process is interrupted, the video will be transcoded by another instance based on the queuing system. You have a large backlog of videos which need to be transcoded and would like to reduce this backlog by adding more instances. You will need these instances only until the backlog is reduced. Which type of Amazon EC2 instances should you use to reduce the backlog in the most cost efficient way?

- A. On-demand instances
- B. Dedicated instances
- **C. Spot instances**
- D. Reserved instances

**Answer: C**
