## Salesforce Certified MuleSoft Developer (Mule-Dev-201) Sample Questions (Q92-Q97):

### NEW QUESTION # 92

Refer to the exhibits.

□

A

web client submits a request to `http://localhost:8081`. What is the structure of the payload at the end of the flow?

- A. □
- B. □
- C. □
- D. □

**Answer: B**

Explanation:

Scatter-Gather Router

The Scatter-Gather component is a routing event processor that processes a Mule event through different parallel processing routes

that contain different event processors. Each route receives a reference to the Mule event and executes a sequence of one or more event processors. Each of these routes uses a separate thread to execute the event processors, and the resulting Mule event can be either the same Mule event without modifications or a new Mule event with its own payload, attributes, and variables. The Scatter-Gather component then combines the Mule events returned by each processing route into a new Mule event that is passed to the next event processor only after every route completes successfully.

The Scatter-Gather component executes each route in parallel, not sequentially. Parallel execution of routes can greatly increase the efficiency of your Mule application and may provide more information than sequential processing.

### NEW QUESTION # 93

What happens to the attributes of a Mule event in a flow after an outbound HTTP Request is made?

- A. Previous attributes are passed unchanged
- B. New attributes may be added from the HTTP response headers, but no headers are ever removed
- C. Attributes are replaced with new attributes from the HTTP Request response (which might be null)
- D. Attributes do not change

**Answer: C**

Explanation:

Attributes are replaced with new attributes from the HTTP Request response.

Attributes include everything apart from Payload/body. For ex: Headers, query parameters, URI parameters.

So, when outbound HTTP request is made, new attributes need to pass the outbound HTTP request and old attributes are replaced.
