Amazon AWS-Certified-Developer-Associate Exam is designed for individuals who are interested in pursuing a career in developing applications for the Amazon Web Services (AWS) platform. AWS-Developer Exam validates the candidate's knowledge of AWS services, development principles, and the ability to design and develop scalable, fault-tolerant, and highly available applications.

Introduction to Amazon AWS-Developer: AWS Certified Developer-Associate Exam

AWS Developer Certification is issued by those who demonstrate technical knowledge and also best practices for developing secure and reliable cloud applications using modern AWS technology. Cloud computing offers companies the ability to change the upfront costs of resource infrastructure with low, variable costs that change as they grow. This personalized responsiveness has canceled the need to plan the infrastructure for the distant future, making hundreds of web servers available as needed and companies have responded, bringing AWS to the forefront of cloud companies. These companies now need AWS-certified developers, and AWS certification verifies the exact skills and understanding they seek. When you're ready to get serious about your cloud credentials, the AWS Associate Examination Certified Programming Authorities Study Guide is the resource you need to pass your shadow-flying exam.

The AWS Certified Developer-Associate test is designed for people who play a role in the development and have one or more years of hands-on experience in the development and maintenance of an AWS-based application.

Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q254-Q259):

NEW QUESTION # 254

A Database Specialist is performing a proof of concept with Amazon Aurora using a small instance to confirm a simple database behavior. When loading a large dataset and creating the index, the Database Specialist encounters the following error message from Aurora:

ERROR: cloud not write block 7507718 of temporary file: No space left on device What is the cause of this error and what should the Database Specialist do to resolve this issue?

- A. The scaling of Aurora storage cannot catch up with the data loading. The Database Specialist needs to enable Aurora storage scaling.
- B. The scaling of Aurora storage cannot catch up with the data loading. The Database Specialist needs to modify the workload to load the data slowly.
- C. The local storage used to store temporary tables is full. The Database Specialist needs to enable local storage scaling.
- **D. The local storage used to store temporary tables is full. The Database Specialist needs to scale up the instance.**

NEW QUESTION # 255

A company is launching a polling application. The application will store the results of each poll in an Amazon DynamoDB table. Management wants to remove poll data after a few days and store an archive of those records in Amazon S3.

Which approach would allow the application to archive each poll's data while keeping complexity to a MINIMUM?

- A. Enable cross-Region replication on the S3 bucket to achieve the poll data.
- B. Schedule an AWS Lambda function to periodically scan the DynamoDB table. Use the BatchWriteItem operation to delete the results of a scan. Enable DynamoDB Stream on the table and store the records removed from the stream in Amazon S3.
- **C. Enable DynamoDB Streams on the table. Configure the stream as trigger for AWS Lambda. Save records to Amazon S3 when records on the stream are modified.**
- D. Enable Time to Live (TTL) on the DynamoDB table. Enable DynamoDB Streams on the table and store the records removed from the stream in Amazon S3.

Answer: C

NEW QUESTION # 256

A Developer is writing an application that will run on Amazon EC2 instances in an Auto Scaling group. The Developer wants to externalize session state to support the application.

Which services will meet these needs? (Choose two.)

- **A. Amazon EBS**
- B. Amazon SQS
- **C. Amazon Cognito**
- D. Amazon ElastiCache
- E. Amazon DynamoDB

Answer: A,C

NEW QUESTION # 257

A Developer created configuration specifications for an AWS Elastic Beanstalk application in a file named healthcheckurl.yaml in the .ebextensions/directory of their application source bundle. The file contains the following:

After the application launches, the health check is not being run on the correct path, even though it is valid.

What can be done to correct this configuration file?

- A. Convert the file to JSON format.
- B. Change the namespace of the option settings to a custom namespace.
- C. Change the configuration section from options_settings to resources.
- **D. Rename the file to a .config extension.**

Answer: D

NEW QUESTION # 258

A company uses more than 100 AWS Lambda functions to handle application services. One Lambda function is critical and must always run successfully. The company notices that occasionally, the critical Lambda function does not initiate. The company investigates the issue and discovers instances of the Lambda TooManyRequestsException: Rate Exceeded error in Amazon CloudWatch logs. Upon further review of the logs, the company notices that some of the non-critical functions run properly while the critical function fails. A developer must resolve the errors and ensure that the critical Lambda function runs successfully. Which solution will meet these requirements with the LEAST operational overhead?

- A. Configure CloudWatch alarms for TooManyRequestsException errors. Add the critical Lambda function as an alarm state change action to invoke the critical function again after a failure.
- **B. Configure reserved concurrency for the critical Lambda function. Set reserved concurrent executions to the appropriate level.**
- C. Configure provisioned concurrency for the critical Lambda function. Set provisioned concurrent executions to the appropriate level.
- D. Configure CloudWatch alarms for TooManyRequestsException errors. Add Amazon EventBridge as an action for the alarm state change. Use EventBridge to invoke the critical function again after a failure.

Answer: B

Explanation:

Reserved concurrency guarantees a specific number of concurrent executions for a critical Lambda function.

This ensures that the critical function always has sufficient resources to execute, even if other functions are consuming concurrency.

Why Option A:

- * Ensures Function Availability: Reserved concurrency isolates the critical Lambda function from other functions.
- * Low Overhead: Configuring reserved concurrency is straightforward and requires minimal setup.

Why Not Other Options:

- * Option B: Provisioned concurrency is ideal for reducing cold starts, not for managing execution limits.
- * Option C & D: Alarms and re-invocation mechanisms add complexity without resolving the root cause.
