

SCAIP–100% Free Latest Braindumps Ppt | High Pass-Rate Latest Saviynt Certified Advanced IGA Professional (Level 200) Test Dumps

Our website offer you the latest SCAIP dumps torrent in pdf version and test engine version, which selected according to your study habit. You can print our SCAIP practice questions out and share the materials with your classmates and friends. The test engine version is a way of exam simulation that helps you get used to the atmosphere of SCAIP Real Exam and solve the problems with great confidence.

For candidates who will buy SCAIP exam braindumps online, the safety of the website is quite important. If you choose SCAIP exam materials of us, we will ensure your safety. With professional technicians examining the website and exam dumps at times, the shopping environment is quite safe. In addition, we offer you instant download for SCAIP Exam Braindumps, and we will send the download link and password to you within ten minutes after payment. And you can start your study immediately.

Use Real Saviynt SCAIP PDF Questions [2026] - 100% Guaranteed Success

It can't be denied that professional certification is an efficient way for employees to show their personal SCAIP abilities. In order to get more chances, more and more people tend to add shining points, for example a certification to their resumes. What you need to do first is to choose a right SCAIP Exam Material, which will save your time and money in the preparation of the SCAIP exam. Our SCAIP latest questions is one of the most wonderful reviewing SCAIP study training materials in our industry, so choose us, and together we will make a brighter future.

Saviynt Certified Advanced IGA Professional (Level 200) Sample Questions (Q21-Q26):

NEW QUESTION # 21

Which HTTP method or methods is used to generate an Authorization Token for Saviynt EIC API?

- A. POST
- B. GIVE
- C. PUT
- D. GET

Answer: A

Explanation:

In Saviynt EIC, generating an Authorization Token for API access is performed using the HTTP POST method.

This is aligned with standard REST API authentication practices, where sensitive information such as credentials (username, password, client ID, or client secret) is securely transmitted in the request body rather than in the URL.

Saviynt provides API endpoints (such as /ECM/api/login) that require a POST request containing authentication details in JSON

format. Upon successful authentication, the system returns a session token or authorization token, which is then used in subsequent API calls (typically passed in headers like Authorization or token).

Option A (PUT) and Option B (GET) are not suitable for authentication token generation. GET exposes parameters in the URL and is not secure for credential transmission, while PUT is typically used for updating resources. Option D (GIVE) is not a valid HTTP method.

Therefore, POST is the correct and secure method used in Saviynt APIs for authentication and token generation, ensuring compliance with RESTful and security best practices.

NEW QUESTION # 22

In EIC, how is the account name for the service account created? (Multi-Select)

- A. Enter Manually while requesting a service account
- B. As defined in Endpoint - > Service Account Name Rule
- C. As defined in Global Configurations - > Account Name Rule
- D. As defined in Connection - > Create Account JSON

Answer: B,D

Explanation:

In Saviynt EIC, the service account name generation is controlled through configuration-driven mechanisms to ensure consistency, automation, and compliance with naming standards.

Option A is correct because administrators can define naming conventions at the Endpoint level using the Service Account Name Rule. This allows dynamic generation of account names based on attributes such as application name, environment, or other identifiers, ensuring standardized naming across systems.

Option D is also correct since in many connector-based integrations, the Create Account JSON configuration plays a role in provisioning. The account name can be derived or constructed within this JSON payload based on defined mappings and logic, especially for REST or custom connectors.

Option B is incorrect because service account creation in Saviynt is typically controlled and standardized; manual entry of account names is generally restricted or governed to avoid inconsistencies. Option C is incorrect because Global Configurations do not directly define service account naming rules in standard implementations.

Thus, the correct answers are Endpoint-based naming rules and Connection-level JSON configuration, ensuring automated and consistent service account naming.

NEW QUESTION # 23

Problem Statement:

Access request approval is not being assigned to the correct approver for a given endpoint.

In this scenario, what configurations will you check? (Multi-Select)

- A. Verify the requester selected the correct approver while submitting the request
- B. Verify if Delegate is configured for the intended approver
- C. Verify the workflow attached to the corresponding Security System to ensure it is correctly configured
- D. Verify the workflow attached to the corresponding Endpoint to ensure it is correctly configured

Answer: B,C,D

Explanation:

In Saviynt EIC, approval assignment for access requests is primarily controlled through workflow configurations, which are associated either at the endpoint level or security system level. Therefore, the first step in troubleshooting incorrect approver assignment is to validate whether the correct workflow is attached and properly configured at both levels (Options A and C). Workflows define approval logic such as manager, owner, or custom approvers, and misconfiguration here often leads to incorrect routing.

Option B is also correct because delegation settings can override the intended approver. If a delegate is configured for an approver, the request may be routed to the delegate instead of the original approver, causing confusion if not validated.

Option D is incorrect because in Saviynt, approvers are typically system-driven based on workflow rules, not manually selected by the requester in most standard configurations. The requester does not usually control approver assignment unless explicitly customized, making this option irrelevant for standard troubleshooting.

NEW QUESTION # 24

In Saviynt App for ServiceNow, the manager is submitting a request for his subordinate, who is a valid SNOW user. However, when searching for the user, they are not appearing in the request form. What could be the potential issue?

- A. The logged in manager requires additional access to submit request
- **B. SNOW user is not linked to imported Saviynt user**
- C. user already has access to the selected application
- D. user does not have the selected application account

Answer: B

Explanation:

In Saviynt-ServiceNow integration, user visibility in request forms depends on proper identity correlation between ServiceNow users and Saviynt identities. The most common reason a valid ServiceNow (SNOW) user does not appear in the request form is that the SNOW user record is not linked or mapped to an imported Saviynt user (Option B).

Saviynt relies on its internal identity repository to populate requestable users. Even if a user exists in ServiceNow, they must also exist in Saviynt and be properly correlated (typically via attributes like username, email, or employee ID). Without this linkage, Saviynt cannot recognize the user during request submission, and therefore the user will not appear in the search results.

Option A is incorrect because even if the user already has access, they would still appear in search results (though requests may be restricted). Option C is unrelated to user visibility. Option D is incorrect because lack of an account does not prevent user selection- it only affects provisioning outcomes.

Thus, proper user correlation between SNOW and Saviynt is essential for request visibility.

NEW QUESTION # 25

Which campaign type should be used when managers must review and certify access for their direct reportees?

- A. Role Owner Campaign
- **B. User Manager Campaign**
- C. Entitlement Owner Campaign
- D. Service Account Campaign

Answer: B

Explanation:

The correct answer is B. User Manager Campaign. In Saviynt, the User Manager campaign is specifically designed for manager-based certifications, where managers review and certify the access of their direct reportees. Saviynt documentation explicitly states that in a User Manager campaign, managers are responsible for reviewing and certifying the access of users who report to them. That makes this campaign type the best fit when the certification driver is the reporting hierarchy rather than entitlement ownership, role ownership, or service account ownership.

The other options represent different certification ownership models. Entitlement Owner Campaign is meant for entitlement owners, Role Owner Campaign is for role owners, and Service Account Campaign is focused on service account ownership verification and access review. Saviynt also describes campaigns as a way to automatically generate and distribute certifications to the appropriate certifiers based on the selected campaign type and ownership model. Therefore, when the requirement clearly says "managers must review direct reportees," the User Manager campaign is the correct and most aligned selection within Saviynt Level 200 scope.

NEW QUESTION # 26

.....

There are many benefits after you pass the SCAIP certification such as you can enter in the big company and double your wage. Our SCAIP study materials boost high passing rate and hit rate so that you needn't worry that you can't pass the test too much. We provide free tryout before the purchase to let you decide whether it is valuable or not by yourself. To further understand the merits and features of our SCAIP Practice Engine, you should try it first!
