NVIDIA-Certified Professional: OpenUSD Development (NCP-OUUSD) Sample Questions (Q33-Q38):

NEW QUESTION # 33

What is the key difference between references and sublayers?

- A. References can only target internal prims
- B. References are weaker than specializes
- C. Sublayers always unload payloads
- **D. References graft a hierarchy at a prim path, while sublayers merge contents like includes**

Answer: D

Explanation:

Sublayers merge entire files, while references graft hierarchies into specific prims.

NEW QUESTION # 34

How does the concept of an edit target (Usd.EditTarget) interact with the stage in OpenUSD?

- **A. It specifies the destination layer for authoring changes in a composed stage.**
- B. It temporarily disables all sublayer compositions during editing.
- C. It overrides all layers, forcing every change to be written to the root layer.
- D. It merges edits across all layers automatically for simplified editing of a stage.

Answer: A

Explanation:

An edit target determines where authored opinions are written while working through the composed view of a stage. NVIDIA's Learn OpenUSD stage material emphasizes that a stage is not simply a file; it is a unified scenegraph populated from multiple data sources called layers. (docs.nvidia.com) In that layered environment, a developer often edits a composed prim while needing the resulting opinion to land in a specific contributing layer, variant, or composition context.

OpenUSD defines this role through UsdEditTarget: edit targets allow work on the composed stage and its UsdPrim objects while specifying which contributing site in the composition network should receive the authored opinions. (opensud.org) Option C is correct because the edit target is the authoring destination, not a composition override mechanism. Option A is incorrect because USD does not automatically merge edits into all layers. Option B is incorrect because edits are not forced to the root layer; developers can target other valid layers or edit contexts. Option D is incorrect because setting an edit target does not disable sublayers or composition arcs.

This aligns with Pipeline Development # Layer Authoring, Edit Targets, Non-Destructive Editing, Stage Workflows, and Collaborative Layer Stacks .

NEW QUESTION # 35

How does an inherits arc differ from directly editing the referenced asset file?

- A. Inherits arcs are weaker than specializes arcs
- B. Inherits arcs erase sublayers
- **C. Direct edits affect every scene, while inherits apply only in the current context**
- D. Inherits only applies to payloads

Answer: C

Explanation:

Direct edits ripple everywhere; inherits allow local context-specific changes.

NEW QUESTION # 36

Which of the following is NOT a benefit of using payloads?

- A. Automatic generation of encapsulation
- B. Ability to load heavy assets on demand
- C. Improved performance for large scenes
- D. Reduced initial load times

Answer: A

Explanation:

Encapsulation must be authored separately; payloads do not create it automatically.

NEW QUESTION # 37

Why do prototype prims like /__Prototype_1 not appear in the .usda file?

- A. Because they must be written manually in a separate .usda
- B. Because they are stored in Book.usd and not in Library.usd
- C. Because prototypes exist only after flattening
- D. Because UsdStage generates them dynamically during composition

Answer: D

Explanation:

Prototype prims are not authored by the user in .usda files. Instead, UsdStage analyzes instanceable prims, creates prototypes automatically, and removes them if no longer needed.
