Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q43-Q48):

NEW QUESTION # 43
An integration team uses Anypoint Platform and follows MuleSoft's recommended approach to full lifecycle API development. Which step should the team's API designer take before the API developers implement the API specification?

- A. Publish the API specification to Exchange and solicit feedback from the API's consumers
- B. Generate test cases using MUnit so the API developers can observe the results of running the API
- C. Use API Manager to version the API specification
- D. Use the scaffolding capability of Anypoint Studio to create an API portal based on the API specification

Answer: A

Explanation:
Design-First Feedback Loop: In the MuleSoft API Lifecycle, after designing the API specification (RAML/OAS) in Design Center, the critical next step is to Publish to Exchange3.
Mocking & Validation: Once in Exchange, the API creates a "Mocking Service." This allows potential consumers (frontend devs, mobile devs) to make test calls against the design before any backend code is written.
Purpose: This solicits feedback to ensure the design meets business needs. If changes are needed, they are made to the spec cheap

and fast, rather than rewriting complex code later (Implementation phase).

NEW QUESTION # 44

An organization's IT team must secure all of the internal APIs within an integration solution by using an API proxy to apply required authentication and authorization policies.

- A. Robotic Process Automation (RPA)
- B. Electronic Data Interchange (EDI)
- C. API Management (APIM)
- D. Integration Platform-as-a-Service (IPaaS)

Answer: C

Explanation:
API Management (APIM): This category of software capability focuses on the Governance, Security, and Lifecycle of APIs. 7 The Role of the Proxy: In MuleSoft's API Manager (the APIM component), you create an API Proxy. This proxy sits in front of the backend API implementation. It intercepts incoming requests, checks security policies (like Client ID enforcement or OAuth 2.0), and only forwards valid requests to the backend.
Why others are incorrect:
iPaaS: Refers to the integration/building platform (connecting systems), though modern platforms like Anypoint combine both iPaaS and APIM. The specific act of securing via proxy is an APIM function.
EDI: Standard for B2B document exchange (like Purchase Orders).
RPA: Automating manual tasks on UI screens.

NEW QUESTION # 45

An organization is choosing between API-led connectivity and other integration approaches.

- A. Improved security through adoption of monolithic architectures
- B. Higher outcome repeatability through centralized development
- C. Increased developer productivity through self-service of API assets
- D. Greater project predictability through tight coupling of systems

Answer: C

Explanation:
The Value Proposition: A primary goal of API-led connectivity is to close the IT delivery gap. It achieves this by turning APIs into reusable Assets published to Exchange. 8 Self-Service: When assets are discoverable, other developers (e.g., Line of Business developers) can reuse them without waiting for central IT to build everything from scratch. This "Self-Service" model significantly increases overall developer productivity.
Why others are incorrect:
Tight Coupling (B): API-led promotes loose coupling. Tight coupling makes systems brittle and hard to change (Point-to-Point).
Centralized Development (C): Creates a bottleneck. API-led enables federated development.
Monolithic (D): API-led breaks monoliths into composable services (Microservices/APIs).

NEW QUESTION # 46

According to MuleSoft, what action should an IT organization take regarding its technology assets in order to close the IT delivery gap?

- A. Focus project delivery efforts on custom assets that meet the specific requirements of each individual line of business
- B. Hire additional staff to meet the demand for asset creation required for approved projects and timelines
- C. Create weekly meetings that all members of IT attend to present justification and request approval to use existing assets
- D. Make assets easily discoverable via a central repository

Answer: D

Explanation:
The Key to Speed: You cannot close the delivery gap by working harder (hiring more staff) or by creating custom code for every project (custom assets). You must leverage Reuse.

Discoverability is Critical: Reuse is impossible if developers don't know that an asset exists.
Anypoint Exchange: By publishing assets (APIs, connectors, fragments) to a central repository (Exchange) and making them searchable and documented, organizations enable "Self-Service." Developers can find what they need instantly, drastically reducing the time to deliver new projects.

NEW QUESTION # 47
A developer needs to discover which API specifications have been created within the organization before starting a new project.

- A. Object Store2
- B. Runtime Manager
- C. API Manager
- D. Anypoint Exchange

Answer: D

Explanation:
4
Anypoint Exchange: This is the central repository and knowledge base o5f the Anypoint Platform. It is designed specifically for Discovery and Reuse. 6 The Workflow: Before building a new integration, a developer searches Exchange to see if an Asset (API Specification, Fragment, Connector, or Template) already exists. This prevents duplication of effort-a core tenet of the API-led connectivity approach.
Why others are incorrect:
Runtime Manager: Used for deploying and monitoring running applications.
API Manager: Used for applying policies and governing APIs, not primarily for discovery by developers.
Object Store: A mechanism for storing data/state within a Mule application.
