IT Specialist HTML5 Application Development Sample Questions (Q54-Q59):

NEW QUESTION # 54

The following output has more text than will fit in the element.

Review

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Mauris lacinia lorem nec mi egestas congue. Etiam tincidunt urna velit. Aliquam nec dolor eu sapien semper tristique quis a tellus. Donec eu fermentum mauris, sit amet viverra nibh. Cras vel dui ac nibh dignissim ultrices id tincidunt erat. Fusce ac venenatis justo, id placerat odio. Curabitur convallis turpis eget mattis euismod. Nullam vestibulum turpis eu turpis tempor, et posuere tellus aliquet. Proin quis metus magna. In finibus mauris eu pretium convallis. Etiam nec ante vel nulla hendrerit lacinia.

You need to apply CSS to contain the text inside the element's border without creating unneeded scrollbars or losing text. Which attribute setting should you use?

- A. `overflow:visible;`
- **B. `overflow:auto;`**
- C. `overflow:scroll;`
- D. `overflow:hidden;`

Answer: B

Explanation:

The correct setting is `overflow: auto;`. The CSS `overflow` property controls how content behaves when it does not fit inside an element's padding box. The requirement has three parts: keep the text inside the element's border, avoid unnecessary scrollbars, and avoid losing text. `overflow: hidden` clips overflowing content and does not provide a user-visible scrollbar, so text can become inaccessible. `overflow: visible` allows excess content to render outside the element's box, failing the containment requirement. `overflow: scroll` makes the element scrollable, but user agents display scrollbars whether or not content is actually overflowing, which violates the requirement to avoid unneeded scrollbars. MDN describes `overflow: auto` as clipping overflow content at the padding box while allowing it to be scrolled into view, with scrollbars displayed only when content is actually overflowing. This makes `auto` the precise choice for a controlled text container. References

NEW QUESTION # 55

The development team just released a new version of an app for your team to test. Which three tasks should you perform during testing? Choose 3.

- A. Check for syntax errors.
- B. Ask customers to submit feature requests.
- C. Ask customers to submit bugs or problems.
- **D. Ensure that the app meets the design specifications.**
- **E. Find any defects in the app.**
- **F. Check application functionality to ensure it works correctly.**

Answer: D,E,F

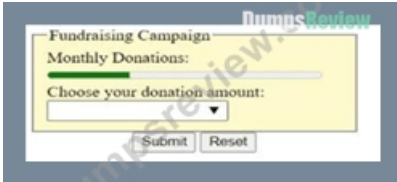

Explanation:

The correct testing tasks are to verify application functionality, find defects, and ensure the app meets design specifications. Testing occurs after development produces a build and before acceptance or deployment decisions are made. Its purpose is to compare the implemented application against expected behavior, requirements, and design specifications. Option A is correct because functional testing confirms that user workflows, controls, validation rules, scripts, and page interactions work as intended. Option C is correct because defect discovery is a core testing responsibility; testers identify failures, inconsistencies, regressions, and unexpected behavior so the development team can correct them. Option D is correct because the app must be evaluated against the documented

design, including layout, navigation, responsiveness, accessibility expectations, and feature behavior. Asking customers to submit bugs or feature requests is a feedback or product-management activity, not the primary task of an internal test cycle immediately following a development release. Checking syntax errors is primarily handled during development, linting, editing, or build processing; a released test build should already parse and execute sufficiently for functional testing.

NEW QUESTION # 57

The ctx variable is the context of an HTML5 canvas object. What does the following HTML markup draw?

`ctx.arc(x, y, r, 0, Math.PI, true);`

- A. A semicircle at the given point
- B. A circle at the given point
- C. A line from one point to another
- D. A square at the given point

Answer: A

Explanation:

The statement draws a semicircle at the specified point. The `arc()` method of the Canvas 2D API adds a circular arc to the current path. Its core parameters are the center point `x, y`, the radius, the starting angle, the ending angle, and an optional direction flag. In this expression, `x` and `y` define the center of the arc, and `r` defines its radius. The start angle is 0 radians, and the end angle is `Math.PI` radians. Since `Math.PI` represents

180 degrees, the path covers exactly half of a full circle. The final argument, `true`, tells the canvas context to draw the arc counterclockwise rather than using the default clockwise direction; however, the angular span remains half of the circumference. The call does not draw a complete visible shape unless the path is later stroked or filled, but the geometric path being created is a semicircular arc. It is not a straight line, square, or full circle. References/topics: Canvas 2D context, `arc()` method, radians, path construction, drawing arcs and circles.

NEW QUESTION # 58

You need to use CSS to create the layout shown:

#1

Mickey	Minnie	Luna	George
Bilbo	Bella	Madeline	Groucho

Review the layout shown on the left.

Complete the markup by selecting the correct option from each drop-down list.

Note: You will receive partial credit for each correct selection.

```
<head>
  <title>Team Building</title>
  <style>
    .grid-container {
      [dropdown]
      display: grid;
      display: block;
      display: flex;

      [dropdown]
      grid-template-columns: auto auto auto auto;
      grid-template-columns: auto auto;
      grid-template-rows: auto auto auto auto;

      [dropdown]
      grid-gap: 10px;
      grid-gap: 0px;
      padding: 20px;

      background-color: #336699;
      padding: 10px;
    }
    .grid-container > div {
      background-color: rgba(255, 255, 255, 0.9);
      text-align: center;
      padding: 20px;
      font-size: 16pt;
    }
  </style>
</head>
```

Answer:

Explanation:

```
<head>
  <title>Team Building</title>
  <style>
    .grid-container {
      
      display: grid;
      display: block;
      display: flex;

      
      grid-template-columns: auto auto auto auto;
      grid-template-columns: auto auto;
      grid-template-rows: auto auto auto auto;

      
      grid-gap: 10px;
      grid-gap: 0px;
      padding: 20px;

      background-color: #336699;
      padding: 10px;
    }
    .grid-container > div {
      background-color: rgba(255, 255, 255, 0.9);
      text-align: center;
      padding: 20px;
      font-size: 16pt;
    }
  </style>
</head>
```

Explanation:

First blank: `display: grid;`

Second blank: `grid-template-columns: auto auto auto auto;`

Third blank: `grid-gap: 10px;`

The layout shown is a CSS Grid layout with eight items arranged into four equal-width columns and two rows. The first required declaration is `display: grid;`, which turns the `.grid-container` element into a grid container. The second declaration is `grid-template-columns: auto auto auto auto;`, which defines four columns, matching the four visible boxes in each row: Mickey, Minnie, Luna, and George on the first row, then Bilbo, Bella, Madeline, and Groucho on the second row. The third declaration is `grid-gap: 10px;`, which creates spacing between the grid cells, matching the visible blue gaps around each item. The `background-color: #336699;` creates the blue container background, while `padding: 10px;` adds space around the outer edge of the grid. The child rule `.grid-container > div` styles each grid item with a light background, centered text, padding, and larger font size.
