## Cisco Designing Cisco Enterprise Wireless Networks Sample Questions (Q53-Q58):

### NEW QUESTION # 53

An engineer is designing a wireless network that will support many different types of wireless clients. When conducting the survey, which client must be used to ensure a consistent experience for all of the wireless clients?

- A. the client that is used least by the company
- **B. the client that is used most by the company**
- C. the client that has the highest RF properties
- D. the client with the worst RF characteristics

**Answer: B**

Explanation:

Section: Wireless Site Survey

### NEW QUESTION # 54

A community bank has three campus locations and one HQ with the data center operations. Each campus location has four Cisco Catalyst 9120 APs. The data center has a Catalyst 9800 WLC with eight Catalyst 9120 APs. Poor WAN uplinks cause impacted branch AP and wireless client connectivity back to HQ, and each campus location is now planned to have its own EWC controller based on C9120 AP to keep traffic local. This new design must accommodate these requirements:

- Guest WLAN will be routed locally.
- Employee WLAN must be authenticated 802.1x PEAP via HQ data center ISE but can pass traffic locally once authenticated.
- HQ WLC will be the primary backup WLC for each WLC.

Which design approach should the consulting engineer take?

- A. One C9120 campus AP must be converted to EWC mode, and the preferred controller is set to that AP with HQ WLC should be paired as mobility peer and configured as N+1 backup. The campus guest WLAN will use local web auth on guest VLAN. The campus employee WLAN will need the guest anchor back to the HQ employee WLAN.
- B. Two C9120 campus APs must be converted to EWC mode, one for the active controller and the other for standby with HQ WLC set as N+1 backup. The campus guest WLAN will use the guest anchor to HQ WLC for guest VLAN access, and employee WLAN will need the HQ AAA server to be added to EWC and then use that to perform the 802.1x authentication.
- **C. One C9120 AP in each campus must be converted to EWC mode, and the preferred controller is set to that AP with HQ WLC set as N+1 backup. The campus guest WLAN will use local web auth on guest VLAN, and employee WLAN will need the HQ AAA server to be added to EWC.**
- D. Two C9120 campus APs must be converted to EWC mode, one for the active controller and the other for standby set as N+1 backup. The campus guest WLAN will use local web auth on guest VLAN, and employee WLAN will need the HQ AAA server added to EW

**Answer: C**

### NEW QUESTION # 55

A customer has a single anchor WLC named Anchor A. Anchor A is in a DMZ and provides guest access. The customer wants to deploy an additional anchor controller named Anchor B to provide redundancy if Anchor A fails. Which design approach should be taken for the guest WLAN priority on the foreign WLC for each anchor WLC?

- A. Set Anchor A to priority 1 and Anchor B to priority 1.
- **B. Set Anchor A to priority 1 and Anchor B to priority 3.**
- C. Set Anchor A to priority 3 and Anchor B to priority 3.
- D. Set Anchor A to priority 3 and Anchor B to priority 1.

**Answer: B**

Explanation:

In a wireless network design where redundancy is required for guest access, setting different priorities for the anchor controllers ensures that one serves as the primary and the other as a backup. Anchor A, being the primary controller, should have a higher priority (lower numerical value), making it the preferred choice for guest WLAN connections. Anchor B, as the secondary or backup controller, should have a lower priority (higher numerical value) so that it is used only if Anchor A fails. This approach provides a failover mechanism for guest access in the DMZ.

#### NEW QUESTION # 56

After the completion of a site survey with Ekahau Site Survey tool, using the default color palette, it is noted that multiple areas are shown as white on the heat map when viewing 5 GHz signal strength data. What does this indicate about the signal strength?

- A. The area is below -67 dBm at coverage cell edge.
- B. The area is below the minimum threshold configured on the tool.
- C. The area is below the detectable level and indicates no RF signal.
- D. The area is below -100 dBm at coverage cell edge.

**Answer: C**

#### NEW QUESTION # 57

An engineer is working for an enterprise and deployed a Cisco 9800 Series Wireless Controller.

The wireless infrastructure serves the employees and guest users across the company. The engineer must configure the controller to alleviate the sticky client issue in the deployment. Which action resolves the issue?

- A. Enable CHDM.
- B. Enable data RSSI to -90db.
- C. Enable 802.11k.
- D. Enable Optimize Roaming.

**Answer: D**

Explanation:

The sticky client issue occurs when a wireless client device clings to a suboptimal access point instead of roaming to a better one with a stronger signal. Enabling Optimize Roaming on the Cisco 9800 Series Wireless Controller can alleviate this issue. This feature prompts clients to roam by disassociating them when their signal strength drops below a threshold, encouraging them to seek a better connection.
