The Amazon AWS-Solutions-Architect-Associate certification will further demonstrate your expertise in your profession and

remove any room for ambiguity on the hiring committee's part. People need to increase their level by getting the Amazon AWS-Solutions-Architect-Associate Certification. You can choose flexible timings for the learning Amazon AWS-Solutions-Architect-Associate exam questions online and practice with Amazon AWS-Solutions-Architect-Associate exam dumps any time.

To be eligible to take the AWS Certified Solutions Architect - Associate exam, candidates must have at least one year of hands-on experience designing and deploying scalable and reliable applications on AWS. It is also recommended that candidates have a good understanding of AWS services and features, and have experience with at least one programming language.

Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q345-Q350):

NEW QUESTION # 345

A user is planning to launch multiple EC2 instance same as current running instance.

Which of the below mentioned parameters is not copied by Amazon EC2 in the launch wizard when the user has selected the option "Launch more like this"?

- A. Tenancy setting
- B. Shutdown behavior
- **C. Storage**
- D. Termination protection

Answer: C

Explanation:

The Amazon EC2 console provides a "Launch more like this" wizard option that enables the user to use a current instance as a template for launching other instances. This option automatically populates the Amazon EC2 launch wizard with certain configuration details from the selected instance.

The following configuration details are copied from the selected instance into the launch wizard: AMI ID Instance type Availability Zone, or the VPC and subnet in which the selected instance is located Public IPv4 address. If the selected instance currently has a public IPv4 address, the new instance receives a public IPv4 address

- regardless of the selected instance's default public IPv4 address setting.

For more information about public IPv4 addresses, see Public IPv4 Addresses and External DNS Hostnames.

Placement group, if applicable

IAM role associated with the instance, if applicable Shutdown behavior setting (stop or terminate) Termination protection setting (true or false) CloudWatch monitoring (enabled or disabled) Amazon EBS-optimization setting (true or false) Tenancy setting, if launching into a VPC (shared or dedicated) Kernel ID and RAM disk ID, if applicable User data, if specified Tags associated with the instance, if applicable Security groups associated with the instance The following configuration details are not copied from your selected instance; instead, the wizard applies their default settings or behavior:

(VPC only) Number of network interfaces: The default is one network interface, which is the primary network interface (eth0).

Storage: The default storage configuration is determined by the AMI and the instance type.

NEW QUESTION # 346

You are responsible for a web application that consists of an Elastic Load Balancing (ELB) load balancer in front of an Auto Scaling group of Amazon Elastic Compute Cloud (EC2) instances. For a recent deployment of a new version of the application, a new Amazon Machine Image (AMI) was created, and the Auto Scaling group was updated with a new launch configuration that refers to this new AMI. During the deployment, you received complaints from users that the website was responding with errors. All instances passed the ELB health checks.

What should you do in order to avoid errors for future deployments? (Choose two.)

- A. Increase the Elastic Load Balancing Unhealthy Threshold to a higher value to prevent an unhealthy instance from going into service behind the load balancer.
- B. Enable EC2 instance CloudWatch alerts to change the launch configuration's AMI to the previous one. Gradually terminate instances that are using the new AMI.
- C. Add an Elastic Load Balancing health check to the Auto Scaling group. Set a short period for the health checks to operate as soon as possible in order to prevent premature registration of the instance to the load balancer.
- **D. Set the Elastic Load Balancing health check configuration to target a part of the application that fully tests application health and returns an error if the tests fail.**

- E. Create a new launch configuration that refers to the new AMI, and associate it with the group. Double the size of the group, wait for the new instances to become healthy, and reduce back to the original size. If new instances do not become healthy, associate the previous launch configuration.

Answer: D,E

NEW QUESTION # 347

A company is building a two-tier web application to serve dynamic transaction-based content. The data tier is leveraging an Online Transactional Processing (OLTP) database. What services should you leverage to enable an elastic and scalable web tier?

- A. Elastic Load Balancing, Amazon RDS with Multi-AZ, and Amazon 53
- B. Amazon RDS with Multi-AZ and Auto Scaling
- C. **Elastic Load Balancing, Amazon EC2, and Auto Scaling**
- D. Amazon EC2, Amazon DynamoDB, and Amazon 53

Answer: C

NEW QUESTION # 348

A solutions architect is designing the storage architecture for a new web application used for storing and viewing engineering drawings. All application components will be deployed on the AWS infrastructure.

The application design must support caching to minimize the amount of time that users wait for the engineering drawings to load. The application must be able to store petabytes of data. Which combination of storage and caching should the solutions architect use?

- A. Amazon Elastic Block Store (Amazon EBS) volumes with Amazon CloudFront
- B. AWS Storage Gateway with Amazon ElastiCache
- C. **Amazon S3 with Amazon CloudFront**
- D. Amazon S3 Glacier with Amazon ElastiCache

Answer: C

Explanation:

To store and view engineering drawings with caching support, Amazon S3 and Amazon CloudFront are suitable solutions. Amazon S3 can store any amount of data with high durability, availability, and performance. Amazon CloudFront can distribute the engineering drawings to edge locations closer to the users, which can reduce the latency and improve the user experience. Amazon CloudFront can also cache the engineering drawings at the edge locations, which can minimize the amount of time that users wait for the drawings to load.

NEW QUESTION # 349

A company wants to run applications in containers in the AWS Cloud. These applications are stateless and can tolerate disruptions within the underlying infrastructure. The company needs a solution that minimizes cost and operational overhead.

What should a solutions architect do to meet these requirements?

- A. Use On-Demand Instances in an Amazon Elastic Kubernetes Service (Amazon EKS) managed node group.
- B. Use On-Demand Instances in an Amazon EC2 Auto Scaling group to run the application containers.
- C. **Use Spot Instances in an Amazon EC2 Auto Scaling group to run the application containers.**
- D. Use Spot Instances in an Amazon Elastic Kubernetes Service (Amazon EKS) managed node group.

Answer: C
