MSSC Certified Logistics Technician (CLT) 4.0 Sample Questions (Q28-Q33):

NEW QUESTION # 28
Which inventory control method is commonly used with electronic products?

- A. Just-in-time (JIT)
- B. First In Still Here (FISH)
- C. Globally Harmonized System (GHS)
- D. Last In; First Out (LIFO)

Answer: B

Explanation:
First In Still Here (FISH) is an informal industry term humorously describing inventory that has not moved for a long time-often applicable to obsolete or slow-moving items, such as outdated electronics. The CLT "Inventory Control" discussion of stock rotation and turnover stresses avoiding "FISH" inventory, which ties up capital and warehouse space. Electronic products rapidly lose value or technological relevance, so identifying and clearing stagnant stock is vital. CLT encourages using ABC analysis and continuous review to highlight FISH items for markdown, return, or disposal. While not a formal control method like FIFO or JIT, understanding FISH alerts managers to inefficiencies that hinder inventory flow and profitability.

NEW QUESTION # 29
What action is required when an overage is identified?

- A. note overage on Bill of Material

- B. segregate and document
- C. notify the driver
- D. ignore because it is a bonus

Answer: B

Explanation:
In CLT receiving, discrepancies (overages, shortages, damages) are treated through a controlled exception process. Best practice is to segregate any unexpected quantity from standard flow, document the variance against the purchase order/advance notice, and trigger the facility's discrepancy resolution workflow. This prevents accidental putaway, protects inventory accuracy, and provides traceability for supplier/carrier claims. MSSC's CLT "Receive products" key activities emphasize verifying shipments against documents (PO/ASN), identifying and documenting exceptions, and following facility procedures to quarantine or otherwise segregate nonconforming product until disposition. Doing so supports inventory control accuracy and downstream order fulfillment quality. Failing to segregate can contaminate on-hand balances and create picking/shipping errors later. Over-communicating to a driver without documentation does not resolve the record variance, and treating overages as "bonus" violates inventory integrity and contract terms.

NEW QUESTION # 30
A characteristic typical of an effective inventory management system is

- A. an excessively small inventory level to minimize costs
- B. holding only enough inventory to fill half of the demand
- C. maintaining an inventory level that fills storage space to capacity
- D. a sufficient quantity of goods is kept on hand and reordering is performed when necessary

Answer: D

Explanation:
Effective systems balance service level and cost. They maintain enough stock to meet demand through lead time (with safety stock where appropriate) and trigger timely reorders using methods like reorder points, EOQ, or min/max. Extremes-chronic under-stocking (stockouts) or over-stocking (excess carrying cost, obsolescence)-are specifically cautioned against in CLT guidance.

NEW QUESTION # 31
Order picking processing ends

- A. when directed by the supervisor
- B. upon receipt at the warehouse
- C. when the customer receives the order
- D. when the seller receives an order

Answer: C

Explanation:
The CLT defines the end of the order processing cycle as the point when the customer physically receives the order and confirms its condition and accuracy. This closure validates the entire order management system-from entry and picking to packing and shipping. Only at this point is the logistics transaction complete and eligible for final invoicing or proof-of-delivery confirmation. Steps before that (such as internal authorization or shipment departure) represent intermediate stages. By setting this definitive endpoint, CLT reinforces a customer-centric perspective, emphasizing that logistics effectiveness is measured by successful, on-time, accurate delivery to the customer-not merely by internal completion metrics.

NEW QUESTION # 32
Which transportation mode is typically used for low-weight, high-value products such as electronics and jewelry?

- A. Truck
- B. Water
- C. Air
- D. Rail

Answer: C

Explanation:
Air transportation provides the fastest transit times and highest security, making it the preferred mode for low-weight, high-value, and time-sensitive products like electronics, pharmaceuticals, or jewelry. According to CLT 4.0, air freight is ideal when delivery speed outweighs cost concerns, as it minimizes exposure to loss or damage through reduced handling and transit duration. However, air is also the most expensive per-unit cost mode, limited by size and weight constraints. Air shipments typically integrate with just-in-time (JIT) and lean supply chains where quick replenishment is vital. Trucking often handles short-haul distribution; water offers low cost but slow speed; and rail suits heavy, bulk freight. Hence, CLT stresses selecting modes based on balancing cost, time, value density, and customer service needs.

NEW QUESTION # 33
