Download The COF-C02 Minimum Pass Score, Pass The SnowPro Core Certification Exam

If you are still struggling to prepare for passing Snowflake real exam at this moment, our Prep4pass COF-C02 vce dumps can help you preparation easier and faster. Our website can provide you Valid COF-C02 Exam Cram with high pass rate to help you get

certification, and then you will become a good master of certification exam.

Snowflake SnowPro Core Certification Exam Sample Questions (Q694-Q699):

NEW QUESTION # 694

Which activities are managed by Snowflake's Cloud Services layer? (Select TWO).

- A. Access delegation
- B. Query parsing and optimization
- C. Data compression
- D. Authorisation
- E. Data pruning

Answer: B,D

Explanation:

Snowflake's Cloud Services layer is responsible for managing various aspects of the platform that are not directly related to computing or storage. Specifically, it handles authorisation, ensuring that users have appropriate access rights to perform actions or access data. Additionally, it takes care of query parsing and optimization, interpreting SQL queries and optimizing their execution plans for better performance. This layer abstracts much of the platform's complexity, allowing users to focus on their data and queries without managing the underlying infrastructure. References: Snowflake Architecture Documentation

NEW QUESTION # 695

Who can activate and enforce a network policy for all users in a Snowflake account? (Select TWO).

- A. A user with an USERADMIN or higher role
- B. A role that has the NETWORK_POLICY account parameter set
- C. A role that has been granted the ATTACH POLICY privilege
- D. A user with a SECURITYADMIN or higher role
- E. A role that has the ownership of the network policy

Answer: D,E

Explanation:

In Snowflake, a user with the SECURITYADMIN role or higher can activate and enforce a network policy for all users in an account. Additionally, a role that has ownership of the network policy can also activate and enforce it

NEW QUESTION # 696

How can a user get the MOST detailed information about individual table storage details in Snowflake?

- A. TABLES view
- B. SHOW TABLES command
- C. SHOW EXTERNAL TABLES command
- D. TABLE STORAGE METRICS view

Answer: D

Explanation:

To get the most detailed information about individual table storage details in Snowflake, the TABLE STORAGE METRICS view should be used. This Information Schema view provides granular storage metrics for tables within Snowflake, including data related to the size of the table, the amount of data stored, and storage usage over time. It's an essential tool for administrators and users looking to monitor and optimize storage consumption and costs.

* Snowflake Documentation: Information Schema - TABLE STORAGE METRICS View

NEW QUESTION # 697

Which Snowflake object can be used to record DML changes made to a table?

- A. Snowpipe
- B. Task
- **C. Stream**
- D. Stage

Answer: C

Explanation:

Snowflake Streams are used to track and record Data Manipulation Language (DML) changes made to a table. Streams capture changes such as inserts, updates, and deletes, which can then be processed by other Snowflake objects or external applications.

* Creating a Stream:

```
CREATE OR REPLACE STREAM my_stream ON TABLE my_table;
```

* Using Streams: Streams provide a way to process changes incrementally, making it easier to build efficient data pipelines.

* Consuming Stream Data: The captured changes can be consumed using SQL queries or Snowflake tasks.

References:

* Snowflake Documentation: Using Streams

* Snowflake Documentation: Change Data Capture (CDC) with Streams

NEW QUESTION # 698

A user has unloaded data from Snowflake to a stage

Which SQL command should be used to validate which data was loaded into the stage?

- **A. list @file __stage**
- B. verify @file __stage
- C. view @file __stage
- D. show @file __stage

Answer: A

Explanation:

The list command in Snowflake is used to validate and display the list of files in a specified stage. When a user has unloaded data to a stage, running the list @file __stage command will show all the files that have been uploaded to that stage, allowing the user to verify the data that was unloaded.
