You will not regret to choose PassCollection, because choosing it represents the success.

## HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q159-Q164):

### NEW QUESTION # 159

You add a new provider to your configuration and immediately run terraform apply in the CD using the local backend. Why does the apply fail?

- A. Terraform needs you to format your code according to best practices first
- B. **Terraform needs to install the necessary plugins first**
- C. Terraform requires you to manually run terraform plan first
- D. The Terraform CD needs you to log into Terraform Cloud first

### Answer: B

Explanation:

The reason why the apply fails after adding a new provider to the configuration and immediately running terraform apply in the CD using the local backend is because Terraform needs to install the necessary plugins first. Terraform providers are plugins that Terraform uses to interact with various cloud services and other APIs. Each provider has a source address that determines where to download it from. When Terraform encounters a new provider in the configuration, it needs to run terraform init first to install the provider plugins in a local directory. Without the plugins, Terraform cannot communicate with the provider and perform the desired actions. Reference = [Provider Requirements], [Provider Installation]

### NEW QUESTION # 160

Which of these statements about Terraform Cloud workspaces is false?

- A. They have role-based access controls
- B. They can securely store cloud credentials
- C. Plans and applies can be triggered via version control system integrations
- D. **You must use the CLI to switch between workspaces**

### Answer: D

Explanation:

The statement that you must use the CLI to switch between workspaces is false. Terraform Cloud workspaces are different from Terraform CLI workspaces. Terraform Cloud workspaces are required and represent all of the collections of infrastructure in an organization. They are also a major component of role-based access in Terraform Cloud. You can grant individual users and user groups permissions for one or more workspaces that dictate whether they can manage variables, perform runs, etc. You can create, view, and switch between Terraform Cloud workspaces using the Terraform Cloud UI, the Workspaces API, or the Terraform Enterprise Provider<sup>5</sup>. Terraform CLI workspaces are optional and allow you to create multiple distinct instances of a single configuration within one working directory. They are useful for creating disposable environments for testing or experimenting without affecting your main or production environment. You can create, view, and switch between Terraform CLI workspaces using the terraform workspace command<sup>6</sup>. The other statements about Terraform Cloud workspaces are true. They have role-based access controls that allow you to assign permissions to users and teams based on their roles and responsibilities. You can create and manage roles using the Teams API or the Terraform Enterprise Provider<sup>7</sup>. Plans and applies can be triggered via version control system integrations that allow you to link your Terraform Cloud workspaces to your VCS repositories. You can configure VCS settings, webhooks, and branch tracking to automate your Terraform Cloud workflow<sup>8</sup>. They can securely store cloud credentials as sensitive variables that are encrypted at rest and only decrypted when needed. You can manage variables using the Terraform Cloud UI, the Variables API, or the Terraform Enterprise Provider<sup>9</sup>. References = [Workspaces]<sup>5</sup>, [Terraform CLI Workspaces]<sup>6</sup>, [Teams and Organizations]<sup>7</sup>, [VCS Integration]<sup>8</sup>, [Variables]<sup>9</sup>

### NEW QUESTION # 161

The \_\_\_\_\_ determines how Terraform creates, updates, or delete resources.

- A. Terraform configuration
- B. Terraform core
- **C. Terraform provider**
- D. Terraform provisioner

**Answer: C**

Explanation:

Explanation

This is what determines how Terraform creates, updates, or deletes resources, as it is responsible for understanding API interactions with some service and exposing resources and data sources based on that API.

### NEW QUESTION # 162

How does the Terraform cloud integration differ from other state backends such as S3, Consul,etc?

- A. All of the above
- **B. It can execute Terraform runs on dedicated infrastructure in Terraform Cloud**
- C. It doesn't show the output of a terraform apply locally
- D. It is only arable lo paying customers

**Answer: B**

Explanation:

This is how the Terraform Cloud integration differs from other state backends such as S3, Consul, etc., as it allows you to perform remote operations on Terraform Cloud's servers instead of your local machine. The other options are either incorrect or irrelevant.

### NEW QUESTION # 163

You used Terraform to create an ephemeral development environment in the cloud and are now ready to destroy all the infrastructure described by your Terraform configuration. To be safe, you would like to first see all the infrastructure that Terraform will delete.

Which command should you use to show all the resources that will be deleted? (Pick the 2 correct responses)

- **A. Run terraform destroy. This will output all the resources that will be deleted before prompting for approval.**
- **B. Run terraform show -destroy.**
- C. Run terraform state rm \*.

**Answer: A,B**

Explanation:

Running terraform destroy will show all resources that will be deleted before prompting for approval. You can also run terraform plan -destroy to simulate the destruction without actually applying it, which is useful for reviewing the planned changes.
