## Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q33-Q38):

### NEW QUESTION # 33

A large company is migrating its entire IT portfolio to AWS. Each business unit in the company has a standalone AWS account that supports both development and test environments. New accounts to support production workloads will be needed soon. The Finance department requires a centralized method for payment but must maintain visibility into each group's spending to allocate costs.

The Security team requires a centralized mechanism to control IAM usage in all the company's accounts.

What combination of the following options meet the company's needs with the LEAST effort? (Choose two.)

- A. Consolidate all of the company's AWS accounts into a single AWS account. Use tags for billing purposes and IAM's Access Advice feature to enforce the least privilege model.

- B. Use a collection of parameterized AWS CloudFormation templates defining common IAM permissions that are launched into each account. Require all new and existing accounts to launch the appropriate stacks to enforce the least privilege model.
- C. Enable all features of AWS Organizations and establish appropriate service control policies that filter IAM permissions for sub-accounts.
- D. Require each business unit to use its own AWS accounts. Tag each AWS account appropriately and enable Cost Explorer to administer chargebacks.
- E. Use AWS Organizations to create a new organization from a chosen payer account and define an organizational unit hierarchy. Invite the existing accounts to join the organization and create new accounts using Organizations.

**Answer: C,E**

#### NEW QUESTION # 34

A Solutions Architect needs to design a solution that will allow Website Developers to deploy static web content without managing server infrastructure. All web content must be accessed over HTTPS with a custom domain name. The solution should be scalable as the company continues to grow.

Which of the following will provide the MOST cost-effective solution?

- A. Amazon EC2 instance with Amazon EBS
- B. Amazon CloudFront with an Amazon S3 bucket origin
- C. AWS Lambda function with Amazon API Gateway
- D. Amazon S3 with a static website

**Answer: B**

#### NEW QUESTION # 35

A company has a business-critical application that runs on Amazon EC2 instances. The application stores data in an Amazon DynamoDB table. The company must be able to revert the table to any point within the last 24 hours. Which solution meets these requirements with the LEAST operational overhead?

- A. Turn on streams on the table to capture a log of all changes to the table in the last 24 hours. Store a copy of the stream in an Amazon S3 bucket
- B. Use AWS Backup for the table
- C. Use an AWS Lambda function to make an on demand backup of the table every hour
- D. Configure point-in-time recovery for the fabric

**Answer: D**

#### NEW QUESTION # 36

A company maintains an application on an on-premises server. The company wants to automatically redirect users to a static maintenance page hosted on Amazon S3 when the application is unavailable.

What is the MOST efficient method to ensure the users are automatically redirected?

- A. Use Amazon Route 53 to set up multiple A records for both the application and Amazon S3.
- B. Use an Amazon Route 53 failover routing policy, and configure the application as primary and the Amazon S3 static page as secondary.
- C. Use Amazon CloudWatch Events to trigger an AWS Lambda function that changes the DNS to point to the static page.
- D. Use an Amazon Route 53 weighted routing policy, and configure the application higher and the Amazon S3 static page lower.

**Answer: B**

#### NEW QUESTION # 37

A company stores raw collected data in an Amazon S3 bucket. The data is used for several types of analytics on behalf of the company's customers. The type of analytics requested to determines the access pattern on the S3 objects.

The company cannot predict or control the access pattern. The company wants to reduce its S3 costs. Which solution will meet these requirements?

- A. Use S3 Lifecycle rules to transition objects from S3 Standard to Standard-Infrequent Access (S3 Standard-1A).
- B. Use S3 Inventory to identify and transition objects that have not been accessed from S3 Standard to S3 Intelligent-Tiering.
- **C. Use S3 Lifecycle rules for transition objects from S3 Standard to S3 Intelligent-Tiering.**
- D. Use S3 replication to transition infrequently accessed objects to S3 Standard-Infrequent Access (S3 Standard-1A)

**Answer: C**

Explanation:

S3 Intelligent-Tiering is a storage class that automatically reduces storage costs by moving data to the most cost-effective access tier based on access frequency. It has two access tiers: frequent access and infrequent access. Data is stored in the frequent access tier by default, and moved to the infrequent access tier after 30 consecutive days of no access. If the data is accessed again, it is moved back to the frequent access tier<sup>1</sup>. By using S3 Lifecycle rules to transition objects from S3 Standard to S3 Intelligent-Tiering, the solution can reduce S3 costs for data with unknown or changing access patterns.

A: Use S3 replication to transition infrequently accessed objects to S3 Standard-Infrequent Access (S3 Standard-1A). This solution will not meet the requirement of reducing S3 costs for data with unknown or changing access patterns, as S3 replication is a feature that copies objects across buckets or Regions for redundancy or compliance purposes. It does not automatically move objects to a different storage class based on access frequency<sup>2</sup>.

B: Use S3 Lifecycle rules to transition objects from S3 Standard to Standard-Infrequent Access (S3 Standard-1A). This solution will not meet the requirement of reducing S3 costs for data with unknown or changing access patterns, as S3 Standard-1A is a storage class that offers lower storage costs than S3 Standard, but charges a retrieval fee for accessing the data. It is suitable for long-lived and infrequently accessed data, not for data with changing access patterns<sup>1</sup>.

D: Use S3 Inventory to identify and transition objects that have not been accessed from S3 Standard to S3 Intelligent-Tiering. This solution will not meet the requirement of reducing S3 costs for data with unknown or changing access patterns, as S3 Inventory is a feature that provides a report of the objects in a bucket and their metadata on a daily or weekly basis. It does not automatically move objects to a different storage class based on access frequency<sup>3</sup>.

S3 Intelligent-Tiering automatically moves objects between two access tiers (frequent and infrequent) based on the access frequency, without any performance impact or retrieval fees. S3 Intelligent-Tiering also has an optional archive tier for objects that are rarely accessed. S3 Lifecycle rules can be used to transition objects from S3 Standard to S3 Intelligent-Tiering.
