問題 #221

You have an Azure subscription.

You have the on-premises sites shown the following table.

Name	Number of users	Connection type to Azure
Site1	500	ExpressRoute
Site2	100	Site-to-Site VPN
Site3	1	Point-to-Site (P2S) VPN

You plan to deploy Azure Virtual WAN.

You are evaluating Virtual WAN Basic and Virtual WAN Standard.

Which type of Virtual WAN can you use for each site? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

問題 #222

You have an Azure subscription that contains an Azure application gateway named AG1 and two Azure App Service apps named App1 and App2 that have the following configurations:

- * Both apps are accessible by using HTTP and HTTPS.
- * HTTP host headers are used to route requests to the appropriate apps.
- * Both apps are hosted in a single App Service Environment in the West Europe Azure region.

You need to publish the apps by using AG1. The solution must ensure that AG1 provides both HTTP and HTTPS access. What is the minimum number of resources required for AG1? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

問題 #223

You have an Azure subscription that contains the resources shown in the following table.

Name	Type
NSG1	Network security group (NSG)
VM1	Virtual machine
VM2	Virtual machine

NSG1 is associated to the NIC of VM1 and contains the rules shown in the following table.

Name	Priority	Direction	Protocol	Action
Rule1	100	Inbound	RDP	Allow
Rule2	101	Inbound	SSH	Allow

You collect NSG flow logs for five minutes for the following activities:

- * Two RDP sessions from VM1 to VM2, each initiated from a different TCP port
 - * Three SSH sessions from VM2 to VM1, each initiated from a different TCP port
- You analyze the logs by using Traffic Analytics in Azure Network Watcher. How many aggregated flow entries will Traffic Analytics identify?

- A. 0
- B. 1
- C. 2
- D. 3

答案: C

問題 #224

You have an Azure virtual network named Vnet1 that connects to an on-premises network.

You have an Azure Storage account named storageaccount1 that contains blob storage.

You need to configure a private endpoint for the blob storage. The solution must meet the following requirements:

- * Ensure that all on-premises users can access storageaccount1 through the private endpoint.
- * Prevent access to storageaccount1 from being interrupted.

Which four actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Actions

Answer Area

- Install the DNS server role and configure the forwarding of blob.core.windows.net to 168.63.129.16
- Configure on-premises DNS servers to forward blob.core.windows.net to the virtual machine
- Configure a private endpoint on storageaccount1 and disable public access to the account
- Configure on-premises DNS server to forward blob.core.windows.net to 168.63.129.16
- Deploy a virtual machine to a subnet in Vnet1

答案：

解題說明：

Actions

- Install the DNS server role and configure the forwarding of blob.core.windows.net to 168.63.129.16
- Configure on-premises DNS servers to forward blob.core.windows.net to the virtual machine
- Configure a private endpoint on storageaccount1 and disable public access to the account
- Configure on-premises DNS server to forward blob.core.windows.net to 168.63.129.16
- Deploy a virtual machine to a subnet in Vnet1

Answer Area

- Configure a private endpoint on storageaccount1 and disable public access to the account
- Deploy a virtual machine to a subnet in Vnet1
- Install the DNS server role and configure the forwarding of blob.core.windows.net to 168.63.129.16
- Configure on-premises DNS servers to forward blob.core.windows.net to the virtual machine

Explanation:

- Configure a private endpoint on storageaccount1 and disable public access to the account
- Deploy a virtual machine to a subnet in Vnet1
- Install the DNS server role and configure the forwarding of blob.core.windows.net to 168.63.129.16
- Configure on-premises DNS servers to forward blob.core.windows.net to the virtual machine

168.63.129.16 is the IP address of Azure DNS which hosts Azure Private DNS zones. It is only accessible from within a VNet which is why we need to forward on-prem DNS requests to the VM running DNS in the VNet. The VM will then forward the request to Azure DNS for the IP of the storage account private endpoint.
