DumpsTests have made customizable EMC D-PWF-OE-00 practice tests so that users can take unlimited tests and improve Dell PowerFlex Operate Exam exam preparation day by day. These D-PWF-OE-00 practice tests are based on the real examination scenario so the students can feel the pressure and learn to deal with it. The customers can access the result of their previous given D-PWF-OE-00 Exam history and try not to make any excessive mistakes in the future. The Dell PowerFlex Operate Exam practice tests have customizable time and D-PWF-OE-00 exam questions feature so that the students can set the time and D-PWF-OE-00 exam questions according to their needs.

With our D-PWF-OE-00 practice test software, you can simply assess yourself by going through the D-PWF-OE-00 practice tests. We highly recommend going through the D-PWF-OE-00 answers multiple times so you can assess your preparation for the D-PWF-OE-00 exam. Make sure that you are preparing yourself for the D-PWF-OE-00 test with our practice test software as it will help you get a clear idea of the real D-PWF-OE-00 exam scenario. By passing the exams multiple times on practice test software, you will be able to pass the real D-PWF-OE-00 test in the first attempt.

You can see the recruitment on the Internet, and the requirements for D-PWF-OE-00 certification are getting higher and higher. As the old saying goes, skills will never be burden. So for us, with one more certification, we will have one more bargaining chip in the future. However, it is difficult for many people to get a D-PWF-OE-00 Certification, but we are here to offer you help. We have helped tens of thousands of our customers achieve their certification with our excellent D-PWF-OE-00 exam braindumps.

EMC Dell PowerFlex Operate Exam Sample Questions (Q79-Q84):

NEW QUESTION # 79

What is the primary purpose of PowerFlex Manager?

- A. Manage virtual machines
- B. Configure fault sets
- C. Automate deployment and lifecycle management
- D. Create snapshots of storage volumes

Answer: C

Explanation:

PowerFlex Manager (PFxM) is the orchestration and automation appliance.

* Automate deployment and lifecycle management (Option B): PFXM is designed to take bare-metal servers and automatically deploy the OS, networking, and PowerFlex software to build a cluster. Once built, it handles the Lifecycle Management (LCM), automating complex tasks like firmware upgrades, software patches, and node expansions without downtime.

Incorrect Options: Managing VMs (A) is for vCenter. Creating snapshots (C) and configuring Fault Sets (D) are storage tasks performed via the PowerFlex GUI/Block Controller, whereas PFXM focuses on the infrastructure lifecycle.

NEW QUESTION # 80

Which specific operations can be performed on PowerFlex volumes? (Choose two)

- A. Create snapshots
- B. Enable data replication
- C. Assign volumes to Protection Domains
- D. Configure VLAN tagging directly on the volume

Answer: A,B

Explanation:

PowerFlex Volumes are block-level storage devices mapped to hosts.

* Create Snapshots (Option A): Snapshots are point-in-time copies of a volume. In PowerFlex, snapshots are writable and instantaneous. They share the same data blocks as the source volume until changes are made (Redirect-on-Write). They are essential for backups, testing/dev environments, and creating clones.

* Enable Data Replication (Option D): PowerFlex supports native asynchronous and synchronous replication. This is configured at the Volume level (or via Consistency Groups containing volumes).

You select a volume and pair it with a destination volume on a remote PowerFlex cluster to ensure disaster recovery.

Incorrect Options:

* VLAN tagging (B): This is a network configuration performed at the OS/Switch/Interface level, not on a storage block volume.

* Assign to PD (C): Volumes reside inside a Storage Pool, which resides inside a Protection Domain.

You assign a volume to a Storage Pool upon creation, not directly to a Protection Domain.

NEW QUESTION # 81

What is the default state of snapshots created in PowerFlex?

- A. Active
- B. Archived
- C. Read-only
- D. Editable

Answer: D

Explanation:

* Editable (Writable): Unlike many traditional storage arrays where a snapshot is a read-only frozen image requiring a "clone" to become writable, PowerFlex snapshots are fully writable volumes by default.

* Behavior: Immediately upon creation, a snapshot is mapped as a volume. You can mount it to a host, write new data to it, delete files from it, or format it, without affecting the source parent volume (due to the Redirect-on-Write architecture).

NEW QUESTION # 82

What is the function of a Storage Pool in PowerFlex?

- A. Manage snapshots and replication
- **B. Group disks with similar performance characteristics**
- C. Allocate storage resources for virtual machines
- D. Monitor storage usage trends

Answer: B

Explanation:

* Group disks with similar performance characteristics (Option C): The primary architectural purpose of a Storage Pool is to aggregate physical drives that share the same performance profile (e.g., "All SAS SSDs" or "All NVMe").

* Performance Uniformity: PowerFlex stripes data across all disks in a pool. If you were to mix slow HDDs and fast SSDs in the same pool, the performance of the entire pool would be dragged down by the slower drives (the "straggler" effect). Therefore, pools are used to segregate media to guarantee consistent IOPS and latency for the volumes created within them.

NEW QUESTION # 83

Which characteristics define a Fault Set in PowerFlex? (Choose two).

- A. Contains metadata for storage pools
- B. Requires a minimum of 3 nodes
- **C. Ensures data availability during node failure**
- **D. Is limited to a single Protection Domain**

Answer: C,D

Explanation:

* Is limited to a single Protection Domain (Option D): A Fault Set is a logical subdivision within a Protection Domain. You cannot span a Fault Set across multiple Protection Domains.

* Ensures data availability (Option C): The purpose of a Fault Set is to simulate "Rack Awareness." PowerFlex ensures that copies of data (mirrors) are never placed in the same Fault Set. If Fault Set 1 (Rack 1) fails completely, the system guarantees that the secondary copies of that data exist in Fault Set 2 or 3, keeping the data available.

Note on C: While a cluster using Fault Sets requires 3+ nodes total, the definition of the Fault Set itself is about availability (B) and its hierarchy (D).
