## Amazon SCS-C02 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> <li>• <b>Data Protection:</b> AWS Security specialists learn to ensure data confidentiality and integrity for data in transit and at rest. Topics include lifecycle management of data at rest, credential protection, and cryptographic key management. These capabilities are central to managing sensitive data securely, reflecting the exam's focus on advanced data protection strategies.</li> </ul>
Topic 2	<ul style="list-style-type: none"> <li>• <b>Identity and Access Management:</b> The topic equips AWS Security specialists with skills to design, implement, and troubleshoot authentication and authorization mechanisms for AWS resources. By emphasizing secure identity management practices, this area addresses foundational competencies required for effective access control, a vital aspect of the certification exam.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>• <b>Security Logging and Monitoring:</b> This topic prepares AWS Security specialists to design and implement robust monitoring and alerting systems for addressing security events. It emphasizes troubleshooting logging solutions and analyzing logs to enhance threat visibility.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>• <b>Threat Detection and Incident Response:</b> In this topic, AWS Security specialists gain expertise in crafting incident response plans and detecting security threats and anomalies using AWS services. It delves into effective strategies for responding to compromised resources and workloads, ensuring readiness to manage security incidents. Mastering these concepts is critical for handling scenarios assessed in the SCS-C02 Exam.</li> </ul>

### Amazon AWS Certified Security - Specialty Sample Questions (Q368-Q373):

#### NEW QUESTION # 368

A security engineer is configuring account-based access control (ABAC) to allow only specific principals to put objects into an Amazon S3 bucket. The principals already have access to Amazon S3.

The security engineer needs to configure a bucket policy that allows principals to put objects into the S3 bucket only if the value of the Team tag on the object matches the value of the Team tag that is associated with the principal. During testing, the security engineer notices that a principal can still put objects into the S3 bucket when the tag values do not match.

Which combination of factors are causing the PutObject operation to succeed when the tag values are different? (Select TWO.)

- A. The bucket policy does not apply to principals in the same zone of trust.
- B. The S3 bucket's resource policy cannot allow actions to the principal.
- C. The principal's identity-based policy overrides the condition because the identity-based policy contains an explicit allow.
- **D. The principal's identity-based policy grants access to put objects into the S3 bucket with no conditions.**
- **E. The S3 bucket's resource policy does not deny access to put objects.**

**Answer: D,E**

Explanation:

The correct answer is A and C.

When using ABAC, the principal's identity-based policy and the S3 bucket's resource policy are both evaluated to determine the effective permissions. If either policy grants access to the principal, the action is allowed. If either policy denies access to the principal, the action is denied. Therefore, to enforce the tag-based condition, both policies must deny access when the tag values do not match.

In this case, the principal's identity-based policy grants access to put objects into the S3 bucket with no conditions (A), which means that the policy does not check for the tag values. This policy overrides the condition in the bucket policy because an explicit allow always takes precedence over an implicit deny. The bucket policy can only allow or deny actions to the principal based on the condition, but it cannot override the identity-based policy.

The S3 bucket's resource policy does not deny access to put objects, which means that it also does not check for the tag values. The bucket policy can only allow or deny actions to the principal based on the condition, but it cannot override the identity-based policy.

Therefore, the combination of factors A and C are causing the PutObject operation to succeed when the tag values are different.

#### NEW QUESTION # 369

A company is testing its incident response plan for compromised credentials. The company runs a database on an Amazon EC2 instance and stores the sensitive data-base credentials as a secret in AWS Secrets Manager. The secret has rotation configured with an AWS Lambda function that uses the generic rotation function template. The EC2 instance and the Lambda function are deployed in the same private subnet. The VPC has a Secrets Manager VPC endpoint.

A security engineer discovers that the secret cannot rotate. The security engineer determines that the VPC endpoint is working as intended. The Amazon CloudWatch logs contain the following error:

"setSecret: Unable to log into database".

Which solution will resolve this error?

- A. Add an internet gateway to the VPC. Create a NAT gateway in a public sub-net. Update the VPC route tables so that traffic from the Lambda function and traffic from the EC2 instance can reach the Secrets Manager public endpoint.
- **B. Ensure that the security group that is attached to the Lambda function allows outbound connections to the EC2 instance. Ensure that the security group that is attached to the EC2 instance allows inbound connections from the security group that is attached to the Lambda function.**
- C. Use the Secrets Manager list-secrets command in the AWS CLI to list the secret. Identify the database credentials. Use the Secrets Manager rotate-secret command in the AWS CLI to force the immediate rotation of the secret.

- D. Use the AWS Management Console to edit the structure of the secret in Secrets Manager so that the secret automatically conforms with the structure that the database requires.

**Answer: B**

Explanation:

This answer is correct because ensuring that the security groups allow bidirectional communication between the Lambda function and the EC2 instance will resolve the error. The error indicates that the Lambda function cannot connect to the database, which might be due to firewall rules blocking the traffic. By allowing outbound connections from the Lambda function and inbound connections to the EC2 instance, the security engineer can enable the rotation function to access and update the database credentials.

#### **NEW QUESTION # 370**

A development team is attempting to encrypt and decode a secure string parameter from the IAM Systems Manager Parameter Store using an IAM Key Management Service (IAM KMS) CMK. However, each attempt results in an error message being sent to the development team.

Which CMK-related problems possibly account for the error? (Select two.)

- A. The CMK is used in the attempt is using an alias.
- B. The CMK is used in the attempt needs to be rotated.
- C. The CMK is used in the attempt is using the CMKs key ID instead of the CMK ARN.
- **D. The CMK is used in the attempt does not exist.**
- **E. The CMK is used in the attempt is not enabled.**

**Answer: D,E**

#### **NEW QUESTION # 371**

An AWS account administrator created an IAM group and applied the following managed policy to require that each individual user authenticate using multi-factor authentication:

```

"Version": "2012-10-17",
"Statement": [
  {
    "Effect": "Allow",
    "Action": "ec2:*",
    "Resource": "*"
  },
  {
    "Sid": "BlockAnyAccessUnlessSignedInWithMFA",
    "Effect": "Deny",
    "Action": "ec2:*",
    "Resource": "*",
    "Condition": {
      "BoolIfExists": {
        "aws:MultiFactorAuthPresent": false
      }
    }
  }
]

```

After implementing the policy, the administrator receives reports that users are unable to perform Amazon EC2 commands using the AWS CLI.

What should the administrator do to resolve this problem while still enforcing multi-factor authentication?

- A. Implement federated API/CLI access using SAML 2.0, then configure the identity provider to enforce multi-factor authentication.
- B. Change the value of `aws:MultiFactorAuthPresent` to true.
- C. Create a role and enforce multi-factor authentication in the role trust policy. Instruct users to run the `sts assume-role` CLI command and pass `--serial-number` and `--token-code` parameters. Store the resulting values in environment variables. Add `sts:AssumeRole` to `NotAction` in the policy.
- D. Instruct users to run the `aws sts get-session-token` CLI command and pass the multi-factor authentication `--serial-number` and `-token-code` parameters. Use these resulting values to make API/CLI calls.

**Answer: D**

#### NEW QUESTION # 372

An AWS account includes two S3 buckets: `bucket1` and `bucket2`. The `bucket2` does not have a policy defined, but `bucket1` has the following bucket policy:

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": { "AWS": "arn:aws:iam::123456789012:user/alice" },
      "Action": "s3:*",
      "Resource": ["arn:aws:s3:::bucket1", "arn:aws:s3:::bucket1/*"]
    }
  ]
}

```

In addition, the same account has an IAM User named "alice", with the following IAM policy.

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "s3:*",
      "Resource": [
        "arn:aws:s3::bucket2",
        "arn:aws:s3::bucket2/*"
      ]
    }
  ]
}

```

Which buckets can user "alice" access?

- A. bucket1 only
- B. bucket2 only
- C. Both bucket1 and bucket2
- D. Neither bucket1 nor bucket2

**Answer: C**
