Amazon AWS Certified Solutions Architect - Professional Sample Questions (Q165-Q170):

NEW QUESTION # 165
The two policies that you attach to an IAM role are the access policy and the trust policy.
The trust policy identifies who can assume the role and grants the permission in the AWS Lambda account principal by adding the _____ action.

- A. sts:AssumeRole
- B. lambda:InvokeAsync
- C. sts:InvokeAsync
- D. aws:AssumeAdmin

Answer: A

Explanation:
The two policies that you attach to an IAM role are the access policy and the trust policy.
Remember that adding an account to the trust policy of a role is only half of establishing the trust relationship. By default, no users in the trusted accounts can assume the role until the administrator for that account grants the users the permission to assume the role by adding the Amazon Resource Name (ARN) of the role to an Allow element for the sts:AssumeRole action.

NEW QUESTION # 167
A company that tracks medical devices in hospitals wants to migrate its existing storage solution to the AWS Cloud. The company equips all of its devices with sensors that collect location and usage information. This sensor data is sent in unpredictable patterns with large spikes. The data is stored in a MySQL database running on premises at each hospital. The company wants the cloud storage solution to scale with usage.
The company's analytics team uses the sensor data to calculate usage by device type and hospital. The team needs to keep analysis tools running locally while fetching data from the cloud. The team also needs to use existing Java application and SQL queries with as few changes as possible.
How should a solutions architect meet these requirements while ensuring the sensor data is secure?

- A. Store the data in an Amazon Aurora Serverless database. Serve the data through the Aurora Data API using an 1AM user authorized with AWS Identity and Access Management (1AM) and the AWS Secrets Manager ARN.
- B. Store the data in an Amazon Aurora Serverless database. Serve the data through a Network Load Balancer (NLB). Authenticate users using the NLB with credentials stored in AWS Secrets Manager.
- C. Store the data in an Amazon S3 bucket. Serve the data through Amazon QuickSight using an 1AM user authorized with AWS Identity and Access Management (1AM) with the S3 bucket as the data source.
- D. Store the data in an Amazon S3 bucket. Serve the data through Amazon Athena using AWS PrivateLink to secure the

data in transit.

Answer: B
