

New APP Ping Identity PAP-001 Simulations - Test PAP-001 Vce Free

2026 Latest Pass4Test PAP-001 PDF Dumps and PAP-001 Exam Engine Free Share: <https://drive.google.com/open?id=1j5NCF2aT4-LTDYzEbXJEdd52rArWWgN>

Our product is dedicated to providing a better understanding of the the PAP-001 exa, through providing the stimulated environment of the PAP-001 exam, it will benefit you while taking part in the exam. For your benefit, we also have money back gurantee if you fail to pass the exam. Once you have passed the PAP-001 exam, it is directly linked to yur salary and the position of you in your copany. The certificate is also a stimulation of you, it proves that the ability of you is improved,and it will offers you more opportunities in the future job market.

Ping Identity PAP-001 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> General Maintenance and File System: This section of the exam measures the skills of System Engineers and addresses maintenance tasks such as license management, backups, configuration imports or exports, auditing, and product upgrades. It also includes the purpose of log files and an overview of the PingAccess file system structure with important configuration files.
Topic 2	<ul style="list-style-type: none"> Policies and Rules: This section of the exam measures the skills of Security Administrators and focuses on how PingAccess evaluates paths for applying policies and resources. It covers the role of different rule types, their configuration, and the implementation of rule sets and rule set groups for consistent policy enforcement.
Topic 3	<ul style="list-style-type: none"> Installation and Initial Configuration: This section of the exam measures skills of System Engineers and reviews installation prerequisites, methods of installing or removing PingAccess, and securing configuration database passwords. It explains the role of run.properties entries and outlines how to set up a basic on-premise PingAccess cluster.

Topic 4	<ul style="list-style-type: none"> • Integrations: This section of the exam measures skills of System Engineers and explains how PingAccess integrates with token providers, OAuth and OpenID Connect configurations, and site authenticators. It also includes the use of agents and securing web, API, and combined applications through appropriate integration settings.

Real PAP-001 Exam Questions in Three Easy Formats

Many candidates find the Ping Identity PAP-001 exam preparation difficult. They often buy expensive study courses to start their Ping Identity PAP-001 certification exam preparation. However, spending a huge amount on such resources is difficult for many Certified Professional - PingAccess exam applicants. The latest Ping Identity PAP-001 Exam Dumps are the right option for you to prepare for the Ping Identity PAP-001 certification test at home.

Ping Identity Certified Professional - PingAccess Sample Questions (Q38-Q43):

NEW QUESTION # 38

A business requires logs to be written to a centralized Oracle database. Which two actions must the PingAccess administrator take to enable this? (Choose 2 answers.)

- A. Copy the database driver JAR file to the PA_HOME/lib directory.
- B. Configure log4j2.xml and log4j2.db.properties.
- C. Import the database certificate into the Trusted Certificate Group.
- D. Remove the logs located in PA_HOME/log.
- E. Enable the Audit flag in the Resource.

Answer: A,B

Explanation:

PingAccess supports logging directly to a relational database using Log4j database appenders. To enable this:

- * Configure log4j2.xml to use a JDBC Appender.
- * Configure log4j2.db.properties with the database connection information.
- * Provide the appropriate database driver in the PA_HOME/lib directory.

Exact Extract:

"To log to a database, configure log4j2.xml and log4j2.db.properties, and place the JDBC driver JAR file in PA_HOME/lib."

- * Option A is correct - both files must be configured.
- * Option B is incorrect - existing logs do not need removal.
- * Option C is incorrect - enabling audit is unrelated to database logging.
- * Option D is correct - the Oracle JDBC driver must be installed in PA_HOME/lib.
- * Option E is incorrect unless TLS is used to connect to the DB, but it is not required for standard DB logging setup.

NEW QUESTION # 39

A department has a requirement to protect anything in its application that resides in a folder named "escalated," no matter where that folder is in the path. Which path prefix should be used in this situation?

- A. escalated/
- B. */escalated/
- C. /*escalated/
- D. */escalated/+

Answer: B

Explanation:

PingAccess supports flexible path matching for resources using wildcards. If the requirement is to match any path that contains a

folder named "escalated", the correct format is:

* */escalated/# matches any location of the escalated directory within the path.

Exact Extract:

"The asterisk (*) wildcard matches zero or more characters. Use it in resource paths to match folders at any depth."

* Option A (/escalated/) only matches when the resource starts with "escalated/" at the root, not at arbitrary depth.

* Option B (*/*escalated/) is correct - it matches the escalated folder no matter where it occurs.

* Option C (*/*escalated/+) is incorrect - + is not a valid PingAccess wildcard operator.

* *Option D (/escalated/) matches only when the path starts with "escalated" at the first level, not arbitrary positions.

NEW QUESTION # 40

A company has removed the requirement to record back-channel requests from PingAccess to PingFederate in the audit log. Where should the administrator update this behavior without affecting existing applications?

- A. Token Provider
- **B. Token Validation**
- C. Sites
- D. Web Sessions

Answer: B

Explanation:

PingAccess can be configured to log or suppress back-channel requests that occur during token validation with an OAuth/OpenID Connect provider such as PingFederate. These requests happen when PingAccess calls PingFederate to validate access tokens or retrieve key material.

* Exact Extract from PingAccess documentation:

"Back-channel requests are logged during token validation by default. To prevent these requests from being written to the audit log, update the Token Validation settings in PingAccess." This makes Token Validation the correct location for changing the behavior without modifying application-specific configurations.

Why other options are wrong:

* B. Web Sessions

* Incorrect. Web Sessions control user session management and cookie handling, not back-channel token validation traffic.

* C. Sites

* Incorrect. Sites are the definitions of backend servers that PingAccess proxies to. This setting does not affect back-channel logging to PingFederate.

* D. Token Provider

* Incorrect. The Token Provider defines the OIDC/OAuth server (e.g., PingFederate) and its endpoints, but the logging of back-channel requests is not controlled here.

Thus, the correct answer is A. Token Validation.

Reference: PingAccess Administration Guide - Managing Token Validation section.

NEW QUESTION # 41

PingAccess will terminate SSL for multiple proxied applications that share the customer.com URL domain.

The administrator needs different ways to minimize the number of SSL certificates to manage these user-facing applications.

What are two ways this requirement can be met? (Choose 2 answers.)

- A. Assign a Subject Alternative Name Certificate to the Agent Listener
- B. Assign a wildcard certificate to the Agent Listener
- **C. Assign a wildcard certificate to the Engine Listener**
- **D. Assign a Subject Alternative Name Certificate to the Engine Listener**
- E. Assign unique Key Pairs to each Virtual Host

Answer: C,D

Explanation:

PingAccess uses Engine Listeners for SSL termination of proxied applications. To minimize the number of certificates, administrators can:

* Use a wildcard certificate (e.g., *.customer.com) on the engine listener.

* Use a Subject Alternative Name (SAN) certificate that covers multiple FQDNs under the customer.

comdomain.

Exact Extract:

"PingAccess engine listeners can use certificates containing either wildcard entries or Subject Alternative Names to secure multiple applications under a single domain."

* Option A is incorrect - assigning unique key pairs increases, not decreases, certificate management overhead.

* Option B is correct - a wildcard certificate covers all subdomains (e.g., app1.customer.com, app2.customer.com).

* Option C is correct - a SAN certificate lists multiple FQDNs explicitly.

* Option D is incorrect - agent listeners don't handle SSL termination for proxied apps.

* Option E is incorrect for the same reason - agent listeners aren't used for SSL.

NEW QUESTION # 42

An auto parts company wants to protect the path /parts/suspension/struts/manufacture. Resources appear under an application context root of /parts with default ordering.

Which resource will the policy engine select?

- A. //manufacture
- B. /suspension/struts/manufacture
- C. ///manufacture
- D. //struts/manufacture

Answer: B

Explanation:

Because the application context root is /parts, resource paths are defined relative to it. The correct relative path is:

* /suspension/struts/manufacture

Exact Extract:

"Resource matching begins at the context root. The most specific matching path is selected."

* Option A is incorrect - /*/struts/manufacture does not match because it starts with a wildcard, not the defined path.

* Option B is incorrect - /*/manufacture would match less specifically and at a different depth.

* Option C is correct - exact match relative to /parts.

* Option D is incorrect - too generic and not the best match.
