CompTIA Security+ Certification Exam Sample Questions (Q647-Q652):

NEW QUESTION # 647

A forensic engineer determines that the root cause of a compromise is a SQL injection attack. Which of the following should the engineer review to identify the command used by the threat actor?

- A. System log
- B. Metadata
- C. Application log
- D. Netflow log

Answer: C

Explanation:

To identify the exact command or input used during a SQL injection attack, the application log (B) is the most relevant. It records inputs, errors, and processing activities within the application layer.

Under Domain 2.1, CompTIA emphasizes reviewing application logs to detect indicators of malicious activity, including web application attacks like SQL injection.

NEW QUESTION # 648

In order to strengthen a password and prevent a hacker from cracking it, a random string of 36 characters was added to the password. Which of the following best describes this technique?

- A. Tokenization
- B. Salting
- C. Data masking
- D. Key stretching

Answer: B

Explanation:

Adding a random string of characters, known as a "salt," to a password before hashing it is known as salting. This technique strengthens passwords by ensuring that even if two users have the same password, their hashes will be different due to the unique salt, making it much harder for attackers to crack passwords using precomputed tables.

NEW QUESTION # 649

A network engineer is increasing the overall security of network devices and needs to harden the devices. Which of the following will best accomplish this task?

- A. Enabling HTTP administration
- **B. Replacing Telnet with SSH**
- C. Configuring centralized logging
- D. Generating local administrator accounts

Answer: B

NEW QUESTION # 650

A company executive connects to various networks, such as hotel guest Wi-Fi, while traveling. A security analyst needs to provide a solution that will allow the executive to securely access the corporate internal resources. Which of the following would best meet this requirement?

- **A. VPN**
- B. Jump server
- C. EAP
- D. Perimeter network

Answer: A

Explanation:

A VPN establishes an encrypted tunnel over untrusted networks, ensuring the executive can securely access corporate internal resources from any location.

NEW QUESTION # 651

A newly appointed board member with cybersecurity knowledge wants the board of directors to receive a quarterly report detailing the number of incidents that impacted the organization. The systems administrator is creating a way to present the data to the board of directors. Which of the following should the systems administrator use?

- A. Packet captures
- B. Metadata
- C. Vulnerability scans
- **D. Dashboard**

Answer: D

Explanation:

A dashboard is a graphical user interface that provides a visual representation of key performance indicators, metrics, and trends related to security events and incidents. A dashboard can help the board of directors to understand the number and impact of incidents that affected the organization in a given period, as well as the status and effectiveness of the security controls and processes. A dashboard can also allow the board of directors to drill down into specific details or filter the data by various criteria. A packet capture is a method of capturing and analyzing the network traffic that passes through a device or a network segment. A packet capture can provide detailed information about the source, destination, protocol, and content of each packet, but it is not a suitable way to present a summary of incidents to the board of directors.

A vulnerability scan is a process of identifying and assessing the weaknesses and exposures in a system or a network that could be exploited by attackers. A vulnerability scan can help the organization to prioritize and remediate the risks and improve the security posture, but it is not a relevant way to report the number of incidents that occurred in a quarter. Metadata is data that describes other data, such as its format, origin, structure, or context. Metadata can provide useful information about the characteristics and properties of data, but it is not a meaningful way to communicate the impact and frequency of incidents to the board of directors.
