They work together and put all their efforts and ensure the top standard of PrepAwayPDF Salesforce Certified Development Lifecycle and Deployment Architect (Development-Lifecycle-and-Deployment-Architect) exam dumps all the time.

Salesforce Development-Lifecycle-and-Deployment-Architect certification exam is designed to test your expertise in various areas of Salesforce development, including design patterns, governance frameworks, and best practices for development and deployment. It is a comprehensive exam that covers a wide range of topics, such as security, data modeling, data migration, and performance tuning. Candidates who Pass Development-Lifecycle-and-Deployment-Architect Exam are recognized as experts in Salesforce development and deployment, and they are highly valued in the industry.

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q191-Q196):

NEW QUESTION # 191

A Salesforce contractor has built an application for Universal Containers (UC). The contractor will need to deploy multiple times from the contractor's own Salesforce to UC's Salesforce environments. Ultimately, UC has full control of the application's code, including its intellectual property

- A. Managed Package
- **B. Unmanaged Package**
- C. Eclipse IDE
- D. Change Sets.

Answer: B

Explanation:

An unmanaged package is a suitable option for deploying an application from a contractor's own Salesforce to UC's Salesforce environments. An unmanaged package allows the contractor to share the application code with UC, while giving UC full control and ownership of the code. An unmanaged package also does not require a namespace prefix or a security review.

NEW QUESTION # 192

Universal Containers' org is complex but well-organized in unlocked packages with their dependencies. The development team was asked for a new feature, and the package that will be changed has already been identified.

Which environment should be used for this development?

- A. A Developer Pro sandbox with all packages installed.
- **B. A scratch org with the package code that will be changed and its dependencies**
- C. A Developer Pro sandbox with the package code that will be changed and its dependencies installed.
- D. A scratch org with all installed packages.

Answer: B

Explanation:

The best environment for developing a new feature in an org with unlocked packages is a scratch org with the package code that will be changed and its dependencies. A scratch org is a source-driven and disposable deployment of Salesforce code and metadata that is fully configurable and can be created quickly. A scratch org can also install unlocked packages and their dependencies, which can help ensure compatibility and functionality of the new feature. A Developer Pro sandbox is not a good option, as it is not source-driven and can have outdated or conflicting data and metadata.

NEW QUESTION # 193

Universal Containers (UC) is using custom metadata types to control the behavior of a few of the custom functionalities. UC wants to Deploy custom metadata types to production using Metadata API.

Which two data types does UC need to include?

Choose 2 answers

- A. CustomMetadataType
- B. CustomField
- C. CustomMetadata
- D. CustomObject

Answer: A,B

NEW QUESTION # 194

Which are two recommended methods of creating test data in Salesforce?

Choose 2 answers

- A. Utilize Heroku Connect to provide test class data.
- B. Host a mock endpoint to produce sample information from an endpoint.
- C. Reference data from middleware directly within your test class.
- D. Load a CSV as a static resource and reference it in a test class.

Answer: B,D

Explanation:

Utilizing Heroku Connect to provide test class data is not a recommended method of creating test data in Salesforce, as it can introduce unnecessary complexity and dependency on an external system. Referencing data from middleware directly within your test class is also not a good practice, as it can make your test class unreliable and dependent on the availability of the middleware. Hosting a mock endpoint to produce sample information from an endpoint and loading a CSV as a static resource and referencing it in a test class are both valid methods of creating test data in Salesforce, as they allow you to isolate your test class from external factors and ensure consistent results. See Create Test Data for Apex Tests for more details.

NEW QUESTION # 195

Universal Containers (UC) is embarked on a large Salesforce transformation journey, UC's DevOps team raised a question about tracking Salesforce metadata throughout the development lifecycle across sandboxes all the way to production.

As the deployment architect of the project, what should be the recommendation to track which version of each feature in different environments?

- A. Use Salesforce SFDX commands to deploy to different sandboxes.
- B. Use an Excel sheet to track deployment steps and document the SFDX commands.
- C. Use an AppExchange or third-party tool that is specialized in Salesforce deployment.
- D. Use ChangeSet to track deployed customizations.

Answer: C
