Salesforce Salesforce-MuleSoft-Developer-I Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Handling Errors: Handling errors includes describing default error handling in Mule applications and defining custom global default error handlers. It involves comparing On Error Continue and On Error Propagate scopes, creating error handlers for a flow, using the Try scope, and mapping errors to custom application errors.

Topic 2	<ul style="list-style-type: none"> • Building API Implementation Interfaces: This topic involves manually creating a RESTful interface for a Mule application and generating a REST Connector from a RAML specification. It also includes describing the features and benefits of APIKit.
Topic 3	<ul style="list-style-type: none"> • Using Connectors: It focuses on retrieving data from REST services using HTTP Request or REST Connector. Moreover, the topic covers using a Web Service Consumer connector for SOAP web services and the Transform Message component.
Topic 4	<ul style="list-style-type: none"> • Designing APIs: Designing APIs involves describing the lifecycle of the modern API and using RAML to define various aspects of an API. It includes identifying when to use query parameters vs URI parameters, and defining API parameters.
Topic 5	<ul style="list-style-type: none"> • Creating Application Networks: The topic of creating Application Networks encompasses understanding MuleSoft's proposal for closing the IT delivery gap and describing the role and characteristics of the modern API. It also includes the purpose and roles of a Center for Enablement (C4E), and the benefits of API-led.
Topic 6	<ul style="list-style-type: none"> • Deploying and Managing APIs and Integrations: It includes packaging Mule applications for deployment and deploying them to CloudHub. This topic also involves using CloudHub properties, creating and deploying API proxies, connecting an API implementation to API Manager, and applying policies to secure an API.
Topic 7	<ul style="list-style-type: none"> • Debugging and Troubleshooting Mule Applications: Using breakpoints to inspect a Mule event during runtime, installing missing Maven dependencies, and reading and deciphering Mule log error messages are sub-topics of this topic.

Salesforce Certified MuleSoft Developer (Mule-Dev-201) Sample Questions (Q216-Q221):

NEW QUESTION # 216

Which of the below activity doesn't support parallel execution?

- A. Scatter-Gather Router
- B. First Successful Router
- C. Batch job
- **D. Parallel For Each**

Answer: D

Explanation:

The First Successful router iterates through a list of configured processing routes until one of the routes executes successfully. This is sequential execution. In all other options mentioned in the question, we can achieve parallel execution.

NEW QUESTION # 217

How would you debug Mule applications?

- **A. Using debugger component**
- B. Checking RAML specifications
- C. By Deploying apps on production
- D. Use third party debugger application

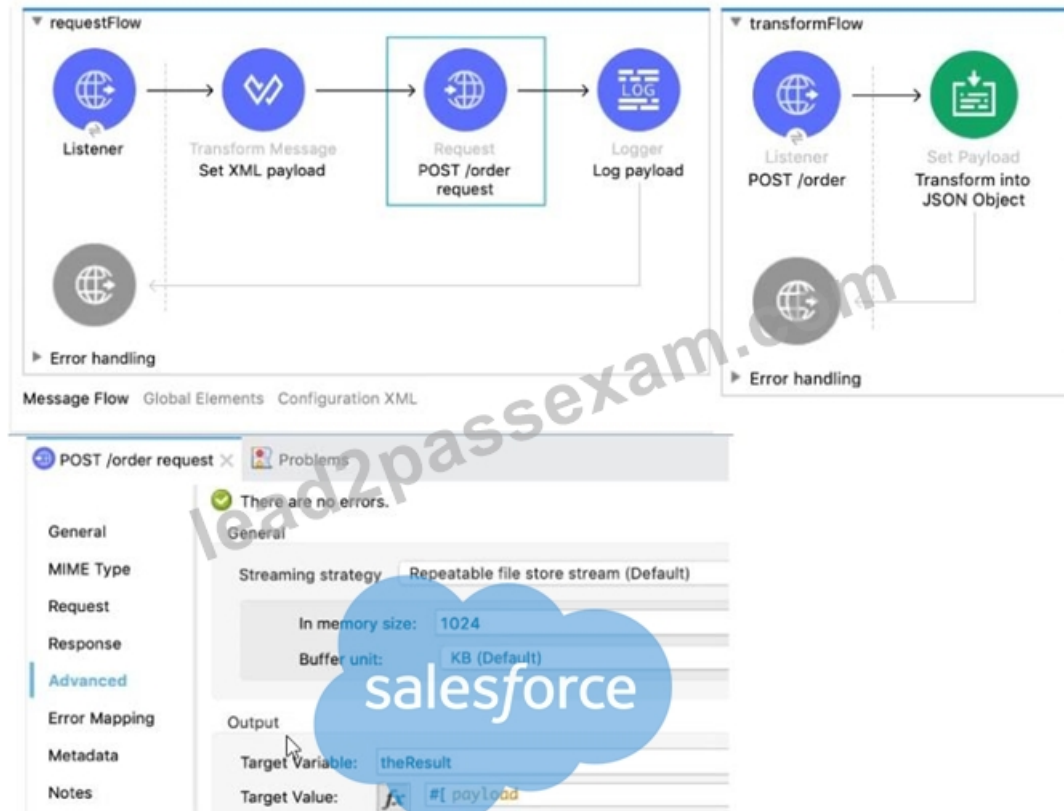

Answer: A

Explanation:

Debugger can be used to debug applications to see event data move from one flow to other

NEW QUESTION # 218

Refer to the exhibits.

In the requestFlow an HTTP Request operation is configured to send an HTTP request with an XML payload. The request is sent to the HTTP Listener in the transform Flow.

That flow transforms the incoming payload into JSON format and returns the response to the HTTP request. The response of the request is stored in a target variable named the Result.

What is the payload at the Logger component after the HTTP Request?

- A. The returned JSON response
- B. The original XML payload
- C. A non-empty Java object
- D. null

Answer: B

NEW QUESTION # 219

Refer to the exhibits.

The main flow contains a Flow Reference component configured to call the child flow. What part(s) of a Mule event passed to the Flow Reference component are available in the child flow?

- A. The payload and all variables
- B. The payload and all attributes
- C. The payload
- D. The entire Mule event

Answer: A

NEW QUESTION # 220

What MuleSoft API-led connectivity layer is intended to expose part of a backend database without business logic?

- A. Experience layer
- B. Data layer
- C. Process layer
- D. System layer

Answer: D

Explanation:

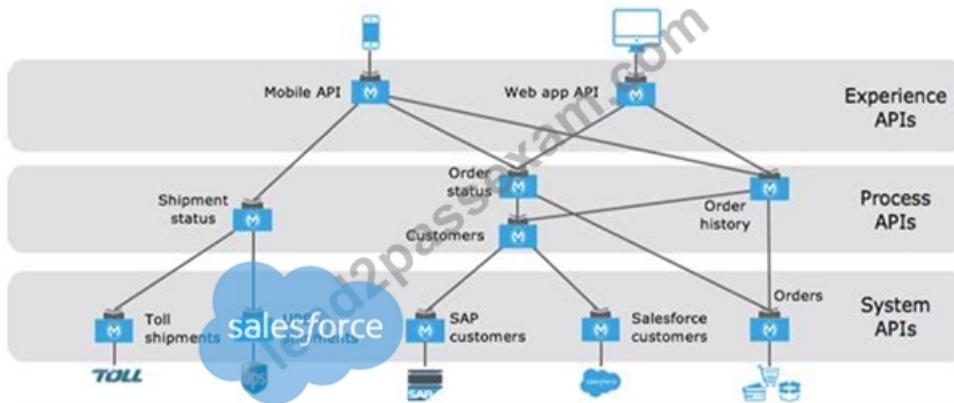

Correct answer is System layer

System APIs provide a means for insulating the data consumers from the complexity or changes to the underlying backend systems. MuleSoft recommends three-layered approach to API-led connectivity, highlighting the three layers:

- * System APIs
- * Process APIs
- * Experience APIs

System APIs are the core systems of record underlying core systems of record (e.g. ERPs, key customer and billing systems, databases, etc.). Process APIs allow you to define a common process which the organization can share, and these APIs perform specific functions, provide access to non-central data, and may be built by either Central IT or Line of Business IT. And finally, the Experience APIs are the means by which data can be reconfigured so that it is most easily consumed by its intended audience, all from a common data source.

The three-layered structure allows for a seamless flow of data from systems of record to new experiences, and allows for reusability of assets rather than point to point connections. This approach provides a distributed and tailored approach to architecture, greater flexibility through loose coupling, and deeper operational visibility into what is being built.
