### Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q292-Q297):

#### NEW QUESTION # 292

A media company is launching a new product platform that artists from around the world can use to upload videos and images directly to an Amazon S3 bucket. The company owns and maintains the S3 bucket. The artists must be able to upload files from personal devices without the need for AWS credentials or an AWS account.

Which solution will meet these requirements MOST securely?

- A. Create a web interface that uses an IAM role that has permission to upload and view objects in the S3 bucket. Share the web interface URL to the artists.
- B. Use an IAM role that has upload permissions for the S3 bucket to generate presigned URLs for S3 prefixes that are specific to each artist. Share the URLs to the artists.
- C. Turn off block public access for the S3 bucket. Share the bucket URL to the artists to enable uploads without credentials.
- D. Enable cross-origin resource sharing (CORS) on the S3 bucket.

#### Answer: B

Explanation:

Option C is the most secure and practical solution. Presigned URLs allow temporary, limited access to upload files to specific S3 prefixes. This ensures that artists can upload files securely without needing AWS credentials or accounts. Each artist receives a unique URL with permissions tied to the intended S3 location, and the URL can be configured to expire after a certain time, minimizing security risks.

Why Other Options Are Incorrect:

Option A: Enabling CORS allows cross-origin access but does not provide authentication or authorization for uploads. This does not secure the uploads or restrict access to specific artists.

Option B: Turning off block public access and sharing the bucket URL exposes the bucket to potential misuse and unauthorized uploads. This approach is highly insecure.

Option D: While a web interface might work, it introduces additional complexity and potential security risks by exposing upload functionality through a public-facing application.

### NEW QUESTION # 293

A company hosts an application on Amazon EC2 On-Demand Instances in an Auto Scaling group.

Application peak hours occur at the same time each day. Application users report slow application performance at the start of peak hours. The application performs normally 2-3 hours after peak hours begin.

The company wants to ensure that the application works properly at the start of peak hours.

Which solution will meet these requirements?

- A. Configure a scheduled scaling policy for the Auto Scaling group to launch new instances before peak hours.
- B. Configure an Application Load Balancer to distribute traffic properly to the Instances.
- C. Configure a dynamic scaling policy for the Auto Scaling group to launch new instances based on CPU utilization.
- D. Configure a dynamic scaling policy for the Auto Scaling group to launch new instances based on memory utilization

**Answer: A**

Explanation:

Understanding the Requirement: The application experiences slow performance at the start of peak hours, but normalizes after a few hours. The goal is to ensure proper performance at the beginning of peak hours.

Analysis of Options:

Application Load Balancer: Ensures proper traffic distribution but does not address the need to have sufficient instances running at the start of peak hours.

Dynamic Scaling Policy Based on Memory or CPU Utilization: While dynamic scaling reacts to usage metrics, it may not preemptively scale in anticipation of peak hours, leading to delays as new instances are launched and become available.

Scheduled Scaling Policy: This allows the Auto Scaling group to launch instances ahead of time, ensuring that enough instances are available and ready to handle the increased load right at the start of peak hours.

Best Solution:

Scheduled Scaling Policy: This approach ensures that new instances are launched and ready before peak hours begin, addressing the slow performance issue at the start of peak periods.

### NEW QUESTION # 294

A company has enabled AWS CloudTrail logs to deliver log files to an Amazon S3 bucket for each of its developer accounts. The company has created a central AWS account for streamlining management and audit reviews. An internal auditor needs to access the CloudTrail logs yet access needs to be restricted for all developer account users. The solution must be secure and optimized. How should a solutions architect meet these requirements?

- A. Configure an AWS Lambda function in the central account to copy the log files from the S3 bucket in each developer account. Create an IAM user in the central account for the auditor. Attach an IAM policy providing full permissions to the bucket.
- B. Configure CloudTrail from each developer account to deliver the log files to an S3 bucket in the central account. Create an IAM user in the central account for the auditor. Attach an IAM policy providing full permissions to the bucket.
- C. Configure CloudTrail from each developer account to deliver the log files to an S3 bucket in the central account. Create an IAM role in the central account for the auditor. Attach an IAM policy providing read-only permissions to the bucket.
- D. Configure an AWS Lambda function in each developer account to copy the log files to the central account. Create an IAM role in the central account for the auditor. Attach an IAM policy providing read-only permissions to the bucket.

**Answer: A**

### NEW QUESTION # 295

A company hosts its enterprise content management platform in one AWS Region but needs to operate the platform across multiple Regions. The company has an Amazon Elastic Kubernetes Service (Amazon EKS) cluster that runs its microservices. The EKS cluster stores and retrieves objects from Amazon S3. The EKS cluster also stores and retrieves metadata from Amazon DynamoDB. Which combination of steps should a solutions architect take to deploy the platform across multiple Regions?

(Select TWO.)

- A. Use AWS Global Accelerator endpoints to distribute the traffic to multiple Regions.
- B. Deploy an EKS cluster and an S3 bucket in another Region. Configure cross-Region replication on both S3 buckets. Turn on global tables for DynamoDB.
- C. Use Amazon S3 access points to give access to the objects across multiple Regions. Configure DynamoDB Accelerator.

(DAX) Connect DAX to the relevant tables.

- D. Use Amazon API Gateway to create a global endpoint to the EKS cluster
- E. Replicate the EKS cluster with cross-Region replication.

**Answer: B,D**

#### NEW QUESTION # 296

You are migrating a legacy client-server application to AWS. The application responds to a specific DNS domain (e.g. www.example.com) and has a 2-tier architecture, with multiple application servers and a database server. Remote clients use TCP to connect to the application servers. The application servers need to know the IP address of the clients in order to function properly and are currently taking that information from the TCP socket. A Multi-AZ RDS MySQL instance will be used for the database. During the migration you can change the application code, but you have to file a change request.

How would you implement the architecture on AWS in order to maximize scalability and high availability?

- A. File a change request to implement Cross-Zone support in the application. Use an ELB with a TCP Listener and Cross-Zone Load Balancing enabled, two application servers in different AZs.
- B. File a change request to implement Latency Based Routing support in the application. Use Route 53 with Latency Based Routing enabled to distribute load on two application servers in different AZs.
- C. File a change request to implement Alias Resource support in the application. Use Route 53 Alias Resource Record to distribute load on two application servers in different AZs.
- D. File a change request to implement Proxy Protocol support in the application. Use an ELB with a TCP Listener and Proxy Protocol enabled to distribute load on two application servers in different AZs.

**Answer: D**
