

SOA-C03 Questions Answers | SOA-C03 Sample Exam

2026 Latest DumpsKing SOA-C03 PDF Dumps and SOA-C03 Exam Engine Free Share: https://drive.google.com/open?id=1Em3OhuDZ3uV5_yoVHpPxq6SVg_pXWmgA

We guarantee you that our top-rated Amazon SOA-C03 practice exam will enable you to pass the Amazon SOA-C03 certification exam on the very first go. The authority of AWS Certified CloudOps Engineer - Associate SOA-C03 Exam Questions rests on its being high-quality and prepared according to the latest pattern.

Considering all customers' sincere requirements, SOA-C03 test question promise to our candidates with plenty of high-quality products, considerate after-sale services. Numerous advantages of SOA-C03 training materials are well-recognized, such as 99% pass rate in the exam, free trial before purchasing, secure privacy protection and so forth. From the customers' perspective, We treasure every customer's reliance and feedback to the optimal SOA-C03 Practice Test and be the best choice.

>> SOA-C03 Questions Answers <<

SOA-C03 Sample Exam & Valid SOA-C03 Exam Labs

There are some loopholes or systemic problems in the use of a product, which is why a lot of online products are maintained for a very late period. The SOA-C03 test material is not exceptional also, in order to let the users to achieve the best product experience, if there is some learning platform system vulnerabilities or bugs, we will check the operation of the SOA-C03 quiz guide in the first time, let the professional service personnel to help user to solve any problems. The AWS Certified CloudOps Engineer - Associate prepare torrent has many professionals, and they monitor the use of the user environment and the safety of the learning platform timely, for there are some problems with those still in the incubation period of strict control, thus to maintain the SOA-C03 Quiz guide timely, let the user comfortable working in a better environment.

Amazon AWS Certified CloudOps Engineer - Associate Sample Questions (Q52-Q57):

NEW QUESTION # 52

A CloudOps engineer needs to track the costs of data transfer between AWS Regions. The CloudOps engineer must implement a solution to send alerts to an email distribution list when transfer costs reach 75% of a specific threshold.

What should the CloudOps engineer do to meet these requirements?

- A. Set up a VPC flow log. Set up a subscription filter to an AWS Lambda function to analyze data transfer. Configure the Lambda function to send a notification to the email distribution list when costs reach 75% of the threshold.
- B. Create an Amazon CloudWatch billing alarm to detect when costs reach 75% of the threshold. Configure the alarm to publish a message to an Amazon Simple Notification Service (Amazon SNS) topic. Subscribe the email distribution list to the topic.
- **C. Use AWS Budgets to create a cost budget for data transfer costs. Set an alert at 75% of the budgeted amount. Configure the budget to send a notification to the email distribution list when costs reach 75% of the threshold.**
- D. Create an AWS Cost and Usage Report. Analyze the results in Amazon Athena. Configure an alarm to publish a message to an Amazon Simple Notification Service (Amazon SNS) topic when costs reach 75% of the threshold. Subscribe the email distribution list to the topic.

Answer: C

Explanation:

According to the AWS Cloud Operations and Cost Management documentation, AWS Budgets is the recommended service to track and alert on cost thresholds across all AWS accounts and resources. It allows users to define cost, usage, or reservation budgets, and configure notifications to trigger when usage or cost reaches defined percentages of the budgeted value (e.g., 75%, 90%, 100%).

The AWS Budgets system integrates natively with Amazon Simple Notification Service (SNS) to deliver alerts to an email distribution list or SNS topic subscribers. AWS Budgets supports granular cost filters, including specific service categories such as data transfer, regions, or linked accounts, ensuring precise visibility into inter-Region transfer costs.

By contrast, CloudWatch billing alarms (Option B) monitor total account charges only and do not allow detailed service-level filtering, such as data transfer between Regions. Cost and Usage Reports (Option A) are for detailed cost analysis, not real-time alerting, and VPC Flow Logs (Option D) capture traffic data, not billing or cost-based metrics.

Thus, using AWS Budgets with a 75% alert threshold best satisfies the operational and notification requirements.

NEW QUESTION # 53

A company's reporting job that used to run in 15 minutes is now taking an hour to run. An application generates the reports. The application runs on Amazon EC2 instances and extracts data from an Amazon RDS for MySQL database.

A CloudOps engineer checks the Amazon CloudWatch dashboard for the RDS instance and notices that the Read IOPS metrics are high, even when the reports are not running. The CloudOps engineer needs to improve the performance and the availability of the RDS instance.

Which solution will meet these requirements?

- A. Increase the size of the RDS instance.
- B. Create an Amazon CloudFront distribution. Set the RDS instance as the origin. Update the reporting job to query the CloudFront distribution.
- C. Configure an Amazon ElastiCache cluster in front of the RDS instance. Update the reporting job to query the ElastiCache cluster.
- **D. Deploy an RDS read replica. Update the reporting job to query the reader endpoint.**

Answer: D

Explanation:

A read replica offloads read traffic from the primary RDS instance to a separate replica, improving both performance (by reducing read load and IOPS on the primary) and availability (the replica can also be promoted in a failure scenario). Pointing the reporting job to the reader endpoint ensures that heavy reporting reads no longer compete with the primary's transactional workload, reducing query latency and speeding up the reports.

NEW QUESTION # 54

A company hosts a web application on an Amazon EC2 instance. Users report that the web application is occasionally unresponsive.

Amazon CloudWatch metrics indicate that the CPU utilization is 100% during these times. A SysOps administrator must implement a solution to monitor for this issue.

Which solution will meet this requirement?

- A. Create a CloudWatch alarm that monitors AWS CloudTrail events for the EC2 instance.
- B. Create an Amazon Simple Notification Service (Amazon SNS) topic to monitor CloudWatch metrics for EC2 instance

CPU utilization.

- C. Create a recurring assessment check on the EC2 instance by using Amazon Inspector to detect deviations in CPU utilization.
- D. Create a CloudWatch alarm that monitors CloudWatch metrics for EC2 instance CPU utilization.

Answer: D

Explanation:

The user's symptom is 100% CPU utilization during unresponsiveness, and CloudWatch monitors CPUUtilization metrics by default (with optional detailed monitoring). Setting a CloudWatch alarm on CPU utilization provides real-time detection of high CPU and can trigger automated actions or notifications to respond quickly. This is the standard, scalable way to monitor and alert on CPU pressure for EC2 instances.

NEW QUESTION # 55

A CloudOps engineer needs to build an event infrastructure for a set of custom application- specific events. The events must be sent to an AWS Lambda function for processing. The CloudOps engineer must record the events to replay later by event type or event time.

Which solution will meet these requirements?

- A. Create an Amazon EventBridge custom event bus. Create an archive on the custom event bus. Create a rule to send the custom events to the Lambda function.
- B. Create a log group in Amazon CloudWatch Logs. Create an Amazon EventBridge rule to send the custom events to the Lambda function and to the log group.
- C. Create an archive on the Amazon EventBridge default event bus. Create an EventBridge pipe to ingest the custom events and to save the custom events in the archive. Create a rule to send the custom events to the Lambda function.
- D. Create an archive on the Amazon EventBridge default event bus. Use pattern matching to record the custom events. Create a rule to send the custom events to the Lambda function.

Answer: A

Explanation:

A custom EventBridge event bus is the correct choice for handling application-specific events.

You can define an archive on that custom event bus to record and later replay events by event type or timestamp. Creating an EventBridge rule to send events to a Lambda function ensures real-time processing while maintaining full replay capability, making this the most flexible and operationally efficient solution.

NEW QUESTION # 56

A company uses Amazon ElastiCache (Redis OSS) to cache application data. A CloudOps engineer must implement a solution to increase the resilience of the cache. The solution also must minimize the recovery time objective (RTO).

Which solution will meet these requirements?

- A. Create an Amazon EventBridge rule to initiate a backup every hour. Restore the backup when necessary.
- B. Replace ElastiCache (Redis OSS) with ElastiCache (Memcached).
- C. Enable automatic backups. Restore the backups when necessary.
- D. Create a read replica in a second Availability Zone. Enable Multi-AZ for the ElastiCache (Redis OSS) replication group.

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of AWS CloudOps Documents:

For high availability and fast failover, ElastiCache for Redis supports replication groups with Multi-AZ and automatic failover. CloudOps guidance states that a primary node can be paired with one or more replicas across multiple Availability Zones; if the primary fails, Redis automatically promotes a replica to primary in seconds, thereby minimizing RTO. This architecture maintains in-memory data continuity without waiting for backup restore operations. Backups (Options B and D) provide durability but require restore and re-warm procedures that increase RTO and may impact application latency. Switching engines (Option A) to Memcached does not provide Redis replication/failover semantics and would not inherently improve resilience for this use case. Therefore, creating a read replica in a different AZ and enabling Multi-AZ with automatic failover is the prescribed CloudOps pattern to increase resilience and achieve the lowest practical RTO for Redis caches.
