Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q72-Q77):

NEW QUESTION # 72
Which Portworx CRD object is used to set up essential parameters for a Portworx installation?

- A. StorageCluster
- B. VolumeSnapshot
- C. ServiceAccount

Answer: A

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
The StorageCluster Custom Resource Definition (CRD) is the central object used to configure and manage a Portworx installation on Kubernetes. It contains essential parameters including cluster-wide settings, KVDB configuration, storage pool definitions, security options, and CSI driver configurations. The StorageCluster resource declaratively defines how Portworx should be deployed, upgraded, and operated within the Kubernetes cluster. Administrators edit this object to adjust configurations, enabling features like telemetry, monitoring, and cloud integration. Unlike VolumeSnapshot (which manages snapshots) or ServiceAccount (which controls Kubernetes permissions), StorageCluster governs the overall lifecycle and parameters of the Portworx deployment. Portworx operator documentation identifies StorageCluster as the fundamental CRD for installation and configuration management【Pure Storage Portworx Operator Guide source】.

NEW QUESTION # 73
What command should the administrator run if Portworx logs report "Node is not in quorum"?

- A. The administrator should do nothing.
- B. The administrator should run pxctl service status.
- C. The administrator should check output of pxctl status on each storage node.

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:
If Portworx logs indicate that a node is not in quorum, the administrator's first step is to verify the status of each storage node in the cluster using the command pxctl status. This command provides detailed information about node connectivity, quorum status, and cluster health. The quorum is critical for distributed consensus and cluster consistency. Checking each node's status helps identify network partitions, node failures, or communication issues causing quorum loss. Simply running pxctl service status provides service-level info but not the comprehensive node quorum details needed. The Portworx troubleshooting documentation stresses using pxctl status as the primary diagnostic tool when encountering quorum-related alerts to ensure cluster stability and resolve issues promptly【Pure Storage Portworx Troubleshooting Guide source】.

NEW QUESTION # 74
What information is included in the Portworx diagnostics bundle (diags)?

- A. User activity logs, security policies, and firewall rules
- B. Application logs, Kubernetes events, and network configurations
- C. Portworx journal logs, CLI command outputs, and basic OS information

Answer: C

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
The Portworx diagnostics bundle, known as "diags," aggregates comprehensive diagnostic data for troubleshooting. This includes Portworx journal logs, which record detailed system and service events essential for identifying errors or malfunctions. Additionally, the bundle contains outputs from key CLI commands such as pxctl status and pxctl volume list that provide snapshots of the cluster's health, volume states, and configuration at the time of collection. Basic operating system information, including kernel version, disk hardware details, and network interfaces, is also captured to understand the underlying environment. Together, these components equip Portworx support and administrators with the contextual data needed for effective root cause analysis and faster issue resolution. The official Portworx support documentation recommends collecting and submitting this bundle for all significant troubleshooting cases as it expedites problem diagnosis and resolution【Pure Storage Portworx Support Guide source】.

NEW QUESTION # 75
An infrastructure admin wants to restrict installing Portworx on two nodes.
What label does the node need to have?

- A. px/enabled=false
- B. px/service=stop
- C. px/storage-node=false

Answer: A

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
Portworx uses node labeling as a mechanism to control on which Kubernetes nodes Portworx is installed and allowed to operate. To restrict Portworx installation on specific nodes, those nodes should be labeled with px/enabled=false. This label tells the Portworx Operator or installation scripts to exclude these nodes from Portworx deployment, preventing Portworx daemons from running there. This feature is useful for reserving nodes for non-storage workloads or avoiding unsupported hardware. Labels like px/service=stop or px/storage-node=false are not recognized by Portworx as controls for installation exclusion. The official Portworx deployment and node labeling documentation specify px/enabled=false as the standard method for controlling node participation in the storage cluster, offering administrators fine-grained control over cluster topology and resource allocation【Pure Storage Portworx Deployment Guide source】.

NEW QUESTION # 76
When updating the Portworx StorageCluster object to mount the SSL certificate secret, which path should be specified for the AWS_CA_BUNDLE environment variable?

- A. /opt/certs/objectstore.pem
- B. /etc/pwx/objectstore-cert/objectstore.pem
- C. /etc/pwx/objectstore-cert/px-s3-certs

Answer: A

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
When configuring Portworx to communicate securely with an AWS S3-compatible Object Store using custom SSL certificates, the AWS_CA_BUNDLE environment variable must point to the mounted certificate file location. The correct path for this in the StorageCluster spec is /opt/certs/objectstore.pem. This file contains the Certificate Authority (CA) bundle trusted by Portworx to validate TLS connections to the object store. Ensuring this path is correctly specified and the certificate secret properly mounted is critical to prevent TLS handshake failures and enable secure communication. Portworx documentation and configuration samples specify /opt/certs/objectstore.pem as the standard path for the CA bundle within Portworx containers when integrating with custom or private certificate authorities【Pure Storage Portworx Security Guide source】.
