CompTIA Cloud+ (CV0-004) Certification Exam Sample Questions (Q250-Q255):

NEW QUESTION # 250

The PMO wants to streamline the routing and approval of project activities to provide up-to-date visibility of the status. Which of the following collaboration tools would be most appropriate to use?

- A. Wiki knowledge base and search engine
- **B. Workflow and e-signature platform**
- C. Real-time, multi-authoring tool
- D. File-sharing platform and storage system

Answer: B

Explanation:

A workflow and e-signature platform automates approvals, routing, and visibility of project tasks. This ensures that documents and activities are approved quickly and transparently, supporting operational efficiency. Real-time editing or file storage doesn't inherently provide workflow automation.

NEW QUESTION # 251

The change control board received a request to approve a configuration change 10 deploy in the cloud production environment. Which of the following should have already been completed?

- A. Cost benefit analysis
- **B. User acceptance testing**
- C. End-to-end security testing
- D. Penetration test

Answer: B

Explanation:

Before a configuration change is deployed in the cloud production environment, it is crucial to conduct User Acceptance Testing (UAT). UAT involves testing the system by the end-users or clients to ensure it can handle required tasks in real-world scenarios, according to specifications. This testing is the final stage before the change is approved for production, ensuring that all functionalities meet user requirements and the system is ready for deployment.

The CompTIA Cloud+ certification highlights the significance of various testing phases, including UAT, as part of the cloud deployment process to validate the system's readiness and functionality for end-users.

NEW QUESTION # 252

A company wants to use a solution that will allow for quick recovery from ransomware attacks, as well as intentional and unintentional attacks on data integrity and availability. Which of the following should the company implement that will minimize administrative overhead?

- A. Object versioning
- B. Off-site backups
- C. Data replication
- **D. Volume snapshots**

Answer: D

Explanation:

Implementing volume snapshots is an effective solution for quick recovery from ransomware attacks and protecting data integrity and availability. Snapshots capture the state of a storage volume at a point in time and can be used to restore data quickly with minimal administrative overhead. References: Data protection strategies like volume snapshots are discussed under cloud data management and protection in the CompTIA Cloud+ objectives.

NEW QUESTION # 253

A company's website suddenly crashed. A cloud engineer investigates the following logs:

```
webbapp_access.log
...
2023-04-03 16:45:00 GET /home?x=213
2023-04-03 16:45:01 GET /home?x=6544
2023-04-03 16:45:02 GET /home?x=52455
2023-04-03 16:45:03 GET /home?x=56
2023-04-03 16:45:04 GET /home?x=7895
...
2023-04-03 16:47:00 GET /home?x=3986 502
2023-04-03 16:47:01 GET /home?x=2461 502
```

Which of the following is the most likely cause of the issue?

- A. DDoS
- B. Cross-site scripting
- C. SQL injection
- D. Leaked credentials

Answer: A

Explanation:

The logs indicate a sudden surge in access requests to the website's homepage, followed by 502 errors, which are indicative of server overload or failure to handle incoming requests. This pattern is typical of a Distributed Denial of Service (DDoS) attack, where multiple compromised systems flood the target with traffic, exceeding its capacity to handle requests, leading to service disruption.

NEW QUESTION # 254

A cloud engineer has provisioned a VM for a high-frequency trading application. After the VM is put into production, users report high latency in trades. The engineer checks the last six hours of VM metrics and sees the following:

- CPU utilization is between 30% to 60%.
- NetworkIn is between 50Kbps and 70Kbps.
- NetworkOut is between 3.000Kbps and 5.000Kbps.
- DiskReadOps is at 30.
- DiskWriteOps is at 70
- Memory utilization is between 50% and 70%.

Which of the following steps should the engineer take next to solve the latency issue?

- A. Increase the instance size to allocate more vCPUs as the CPU utilization is very high.
- B. Increase the memory of the instance as the high-frequency trading application requires more RAM.
- C. Move to a network-optimized instance type as the network throughput is not enough.
- D. Modify the disk IOPS to a higher value as the disk IO is being bottlenecked at 100 IOPS.

Answer: C

Explanation:

Since the NetworkOut is significantly higher than NetworkIn and considering the nature of a high-frequency trading application, the issue most likely lies with network throughput. Moving to a network-optimized instance type would provide higher network bandwidth, which can reduce latency in trades.
