In order to ensure the quality of Integration-Architect actual exam, we have made a lot of efforts. Our company spent a great deal of money on hiring hundreds of experts and they formed a team to write the work. The qualifications of these experts are very high. They have rich knowledge and rich experience on Integration-Architect study guide. These experts spent a lot of time before the Integration-Architect Study Materials officially met with everyone. And we have made scientific arrangements for the content of the Integration-Architect actual exam. You will be able to pass the Integration-Architect exam with our excellent Integration-Architect exam questions.

Salesforce Integration-Architect Certification is designed to test your knowledge and expertise in the field of Salesforce Integration. Salesforce Certified Integration Architect certification covers a broad range of topics, including integration architecture, data architecture, API management, data migration, web services, and more. Salesforce Certified Integration Architect certification is ideal for technical architects, solution architects, and developers who are looking to validate their expertise in Salesforce Integration.

Salesforce Integration-Architect Certification Exam is a highly sought-after certification in the Salesforce ecosystem. It validates the professional's ability to design and implement seamless, efficient, and effective integrations between Salesforce and other systems. Integration-Architect exam covers a range of topics, including integration architecture, data integration, API integration, security and governance, and performance optimization. Passing this certification exam demonstrates an individual's expertise in designing and implementing robust integration solutions that meet business requirements and maximize the value of Salesforce investments.

The Salesforce Integration-Architect Exam is intended for individuals who have experience working with Salesforce, including knowledge of data modeling, security, and user interface design. Salesforce Certified Integration Architect certification exam covers a wide range of topics, including integration architecture, integration patterns, data integration, and API integration. Candidates are also tested on their knowledge of integration security and performance optimization.

Salesforce Integration-Architect Certification Practice & New Integration-Architect Study Materials

The advent of our Integration-Architect study guide with three versions has helped more than 98 percent of exam candidates get the certificate successfully. Rather than insulating from the requirements of the Integration-Architect real exam, our Integration-Architect practice materials closely co-related with it. And their degree of customer's satisfaction is escalating. Besides, many exam candidates are looking forward to the advent of new Integration-Architect versions in the future.

Salesforce Certified Integration Architect Sample Questions (Q52-Q57):

NEW QUESTION # 52

Northern Trail Outfitters is creating a distributable Salesforce package. The package needs to call into a Custom Apex REST endpoint in the central org. The security team wants to ensure a specific integration account is used in the central org that they will

authorize after installation. Which item should an architect recommend?

- A. Use an encrypted field to store the password that the security team enters.
- B. Contact Salesforce Support and create a case to temporarily enable API access for managed packages.
- C. Create a connected app in the central org and add the callback URL for each org in the package it is installed in to redirect after a successful authentication.

Answer: C

Explanation:

For a distributable package to securely access a central "Hub" org, the architecture must support the OAuth 2.0 Web Server Flow. This flow is designed for applications (like the package installed in a "Spoke" org) that can securely store a Client Secret and need to act on behalf of a specific user.

The Connected App in the central org acts as the "Identity and Access" gatekeeper. A critical component of the Connected App configuration is the Callback URL (Redirect URI). When a user in the "Subscriber" org clicks "Authorize," Salesforce redirects them to the central org to log in. After successful authentication, the central org needs to know where to send the "Authorization Code" back to.

In a multi-org packaging scenario, each subscriber org will have a unique instance URL (e.g., na15.salesforce.

com). The architect must ensure that the Connected App's callback URLs are correctly configured to handle these redirects.

Option C (Encrypted Passwords) is a major security risk and is considered an "anti-pattern" in modern integration. Option A is unnecessary, as API access is a standard feature. By using the Connected App with correct Callback URLs, the architect allows the security team in the central org to oversee exactly which

"Spoke" orgs have authorized access. They can use the "Connected Apps OAuth Usage" page to monitor, rotate secrets, or revoke access for individual orgs, providing the granular security control required for an enterprise-grade distributed Salesforce architecture.

NEW QUESTION # 53

Northern Trail Outfitters uses a custom Java application to display code coverage and test results for all of their enterprise applications and is planning to include Salesforce as well.

Which Salesforce API should an Integration Architect use to meet the requirement?

- A. Tooling API
- B. Metadata API
- C. SOAP API
- D. Analytics REST API

Answer: A

Explanation:

Explanation

Option D is correct because Tooling API is the Salesforce API that can be used to retrieve code coverage and test results for Apex classes and triggers. Tooling API provides REST and SOAP interfaces to access metadata about code, execute tests, and get test results¹² Option A is incorrect because SOAP API is a Salesforce API that can be used to create, retrieve, update, or delete records, but not to get code coverage and test results. SOAP API uses a WSDL file to define the parameters for accessing data through the API³ Option B is incorrect because Analytics REST API is a Salesforce API that can be used to access data from reports and dashboards, but not from code coverage and test results. Analytics REST API provides a programmatic way to interact with analytics features such as lenses, datasets, and dashboards⁴ Option C is incorrect because Metadata API is a Salesforce API that can be used to retrieve, deploy, create, update, or delete customization information, such as custom object definitions and page layouts, but not code coverage and test results. Metadata API is mainly used for development tools or backup tools⁵ References: 1: Introducing Tooling API 2: Tooling API Examples 3: SOAP API Developer Guide 4: Analytics REST API Developer Guide 5: Metadata API Developer Guide

NEW QUESTION # 54

A developer has been tasked by the integration architect to build a solution based on the Streaming API. The developer has done some research and has found there are different implementations of the events in Salesforce (Push Topic Events, Change Data Capture, Generic Streaming, Platform Events), but is unsure of how to proceed with the implementation. The developer asks the system architect for some guidance.

What should the architect consider when making the recommendation?

- A. Apex triggers can subscribe to Generic Events.

- B. Push Topic Event can define a custom payload. B Change Data Capture does not have record access support.
- C. Change Data Capture can be published from Apex.

Answer: C

Explanation:

Push Topic Events can define a custom payload, which is one of the factors that should be considered when choosing a Streaming API implementation. Push Topic Events are based on SOQL queries that define the data changes to be notified of. You can specify the fields to be returned in the event message by using the SELECT clause in the query. This allows you to customize the payload according to your needs. References: Create a PushTopic

NEW QUESTION # 55

A company's cloud-based single page application consolidates data local to the application with data from on premise and 3rd party systems. The diagram below typifies the application's combined use of synchronous and asynchronous calls.

The company wants to use the average response time of its application's user interface as a basis for certain alerts. For this purpose, the following occurs:

1. Log every call's start and finish date and time to a central analytics data store.
2. Compute response time uniformly as the difference between the start and finish date and time - A to H in the diagram.

Which computation represents the end-to-end response time from the user's perspective?

- A. Sum of A to F
- B. Sum of A to H
- C. Sum of A and H
- D. Sum of A, G, and H

Answer: C

Explanation:

The end-to-end response time from the user's perspective is the time elapsed between the user's request and the user's receipt of the final response. In the diagram, this corresponds to the sum of A and H, which are the durations of the synchronous calls from the user interface to the cloud-based application and back. The other durations (B to G) are either internal to the cloud-based application or asynchronous calls that do not affect the user's perception of response time. Therefore, the correct answer is C, because it represents the sum of A and H.

NEW QUESTION # 56

A company that is a leading provider of training delivers courses to students globally. The company decided to use customer community in order to allow student to log in to the community, register for courses and pay course fees. The company has a payment gateway that takes more than 30 seconds to process the payment transaction. Students would like to get the payment result in real-time so in case an error happens, the students can retry the payment process.

What is the recommended integration approach to process payments based on this requirement?

- A. Use continuation to process payment to the payment gateway.
- C. Use change data capture to process payment to the payment gateway.
- B. Use platform event to process payment to the payment gateway.
- D. Use request and reply to make an API call to the payment gateway.

Answer: A
