Veeam Certified Engineer v12 Sample Questions (Q140-Q145):

NEW QUESTION # 140

A company needs to ensure that, during a disaster, a group of VMs starts in a certain order with time delays between starting each VM. How can this be accomplished?

- A. Create a replica chain in the Veeam Backup & Replication console.
- B. Create a failover plan.

- C. Create a failover template file for the group of VMs.
- D. Perform a planned failover.

Answer: B

Explanation:

To ensure that a group of VMs starts in a specific order with time delays during a disaster scenario, the solution is B: Create a failover plan. A failover plan in Veeam Backup & Replication is a feature designed to manage the startup sequence of VMs within a DR site. The failover plan can be customized to specify the order in which VMs should start and to include necessary delays between the startups of each VM. This is especially useful for multi-tier applications where the order of startup is essential for the application stack to become fully operational. By using a failover plan, companies can control the recovery process, ensuring that VMs are brought online in an orderly and coordinated fashion that respects their interdependencies.

NEW QUESTION # 141

A corporation has acquired a new company that needs a data protection strategy that includes disaster recovery to another location. Which backup or recovery method can achieve this goal?

- A. A disaster recovery plan must recover Tier 2 and 3 applications, including bare metal servers, with Veeam Replication.
- B. Use the Veeam Agent for Linux and Storage Snapshots to back up a Linux bare metal server using SAN storage.
- C. Recover Tier 1 applications requiring an RPO of one hour and an RTO of five minutes, restoring from backup copy jobs.
- **D. Recover Tier 1 applications with an RPO of five minutes, running on VMware, using Continuous Data Protection replication.**

Answer: D

Explanation:

Recover Tier 1 applications with an RPO of five minutes, running on VMware, using Continuous Data Protection replication. Continuous Data Protection (CDP) streams every I/O to the DR site, delivering near-zero RPO and automated failover capabilities for VMware workloads.

NEW QUESTION # 142

A mid-sized company uses Veeam Backup and Replication to safeguard their business-critical data from ransomware attacks. The company needs to validate backups and increase security, while improving DevOps efficiency. How can a SureBackup Job be utilized to address the company's specific needs?

- A. Validates backup data and ensures backups are ransomware-free
- **B. Creates a secure, isolated environment to test new applications**
- C. Helps improve the data deduplication and compression ratios
- D. Improves recovery speed reducing RTO

Answer: B

Explanation:

A SureBackup Job in Veeam Backup and Replication can be utilized to create a secure, isolated environment to test new applications. This feature allows companies to validate backups and run their VMs in an isolated environment, providing an opportunity to test applications, patches, or updates without impacting the production environment. NEW QUESTION # 143

When using multi-factor authentication (MFA) for managing access to Veeam Backup & Replication, which role can manage access?

- A. Veeam Backup Operator
- B. Veeam Security Operator
- C. Veeam Account Administrator
- **D. Veeam Backup Administrator**
